Received 9 December 2009; accepted 14 December 2009

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.027; wR factor = 0.072; data-to-parameter ratio = 13.5.

In the title complex, $[\text{FeMn}(\text{C}_8\text{H}_8\text{N}_3)_2\text{Cl}_2(\text{H}_2\text{O})_2]_n$, the Mn^{II} atom, located on an inversion center, is octahedrally coordinated by two N atoms from two adjacent 1,1'-bis(1*H*-1,2,4-triazol-1-ylmethyl)ferrocene (btmf) ligands and two Cl atoms forming the equatorial plane, with the axial positions occupied by two O atoms of coordinated water molecules. The btmf ligands link adjoining Mn^{II} atoms into a zigzag chain along the a axis. The crystal structure is stabilized by intermolecular O–H···N hydrogen bonds, which link the chains, forming a two-dimensional layer parallel to (10 $\bar{1}$); O–H···Cl interactions link the layers, forming a three-dimensional network.

S1. Comment

It is well known that ferrocene complexes undergo reversible redox reactions(Li *et al.*, 2003; Togni & Haltermann, 1998; Beer *et al.*, 1992). Moreover, ferrocene-based bidentate ligands are excellent building blocks and used to metal-organic polymers and supramolecular architectures(Gao *et al.*, 2006; He *et al.*, 2008). Recently, we have been employed ferrocene-containing ligand 1,1'-bis[(1H-1,2,4-triazol-1-yl)methyl]ferrocene(btmf) to construct Co(II) metal-organic polymer (Zhou *et al.*, 2007). Following on from our research work on the coordination chemistry of ferrocene-based bidentate, we focused on the effect of metal ions on the metal-organic polymers. In this paper, we report here the synthesis and crystal structure of the title complex (I).

The Mn^{II} and iron atoms are located on inversion center. Mn^{II} is octahedrally coordinated by two N atoms from two adjacent btmf ligands and two Cl atoms forming the equatorial plane, whereas axial positions are occupied by two O atoms of coordinated water molecules. The distances of Mn-N, Mn-Cl and Mn-O bonds are within normal range. The torsion angle between ferrocene moiety and triazole motif is 62.4 (3) $^{\circ}$, which is near to our reported Co^{II} compound(Zhou *et al.*, 2007). Each btmf molecular clips serve as bridge to link two adjacent Mn^{II} centers into a 1D zigzag chain, as shown in Fig. 1. Comparison of {Co(btmf)₂(CH₃CH₂OH)(H₂O)}ClO₄.3(CH₃CH₂OH)}_n (Zhou *et al.*, 2007) and the title compound indicates that the metal ions may play critical role in modulating the resulting structure.

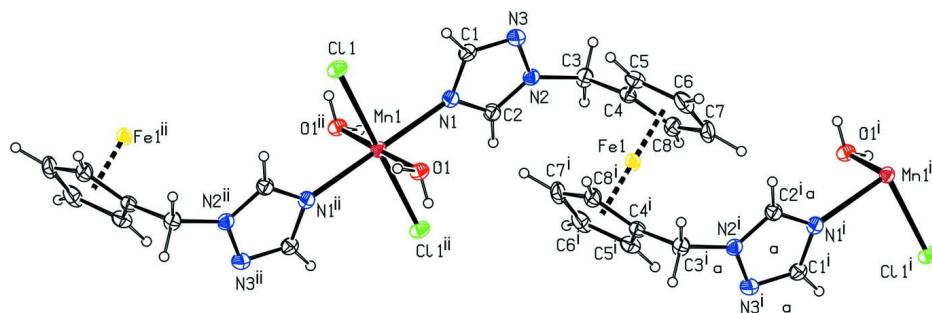

The structure is further stabilized by intermolecular O-H \cdots N, O-H \cdots Cl hydrogen bonds(Table. 1). The O-H \cdots N hydrogen bonds links the chains forming a two dimensionnal layer parallel to the (1 0 -1) plane (Fig. 2) whereas the O-H \cdots Cl interactions links these layers to form a thre dimensionnal network.

S2. Experimental

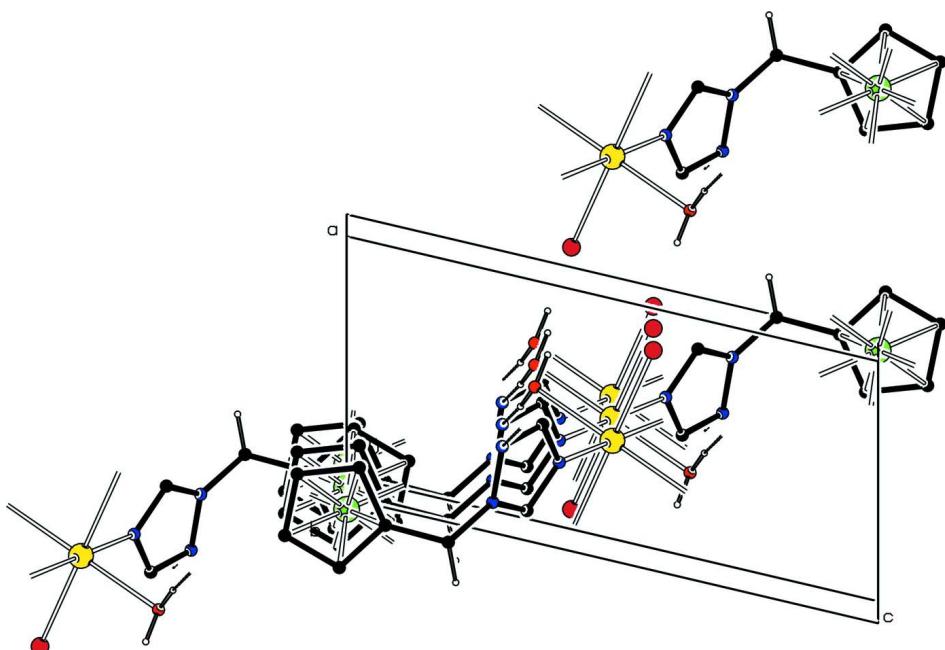

The preparation of btmf ligand followed established method presented in the literature (Wilkes *et al.*, 1995, Sonoda *et al.*, 1971). The synthesis process of the title compound of (I) was same as the {Co(btmf)₂(CH₃CH₂OH)(H₂O)}ClO₄.3(CH₃CH₂OH)}_n (Zhou *et al.*, 2007) compound except for Co(ClO₄)₂ by MnCl₂(1.3mg, 0.01mmol). The well colorless crystals were obtained.

S3. Refinement

The H atoms of btmf ligand were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C-H distances in the range 0.93-0.98 \AA , with U_{iso}(H)=1.2U_{eq}(C). The H atoms of water molecules were located in a difference map and refined with restraints of O-H=0.83 (1) \AA , and with U_{iso}(H)=1.5U_{eq}(O). The highest peak of residual density is located 1.94 \AA from C4 atom.

**Figure 1**

Molecular view of (I) with the atom-labeling scheme. Ellipsoids are drawn at the the 30% probability level. H atoms are shown as spheres of arbitrary radii. [Symmetric codes: (i) -x, 1-y, -z; (ii) -x+1, 1-y, 1-z].

**Figure 2**

Partial packing view showing the formation of layers parallel to the (1 0 -1) plane through O-H...N hydrogen bonds. H atoms not involved in hydrogen bondings have been omitted for clarity.

 $\Delta\rho_{\min} = -0.32 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
