Key indicators: single-crystal X-ray study; $T = 110\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.038; wR factor = 0.095; data-to-parameter ratio = 12.0.

The title compound [systematic name: 3-(10,11-dihydro-5H-dibenzo[*b,f*]azepin-5-yl)-*N,N*,2-trimethylpropan-1-aminium hydrogen maleate], $\text{C}_{20}\text{H}_{27}\text{N}_2^+\cdot\text{C}_4\text{H}_3\text{O}_4^-$, a maleate salt of trimipramine, crystallizes with four independent cation–anion pairs in the asymmetric unit. The trimipramine cation contains a seven-membered azepine ring with two fused benzene rings whose mean planes are separated by $51.7(1)^\circ$. Intermolecular $\text{N}-\text{H}\cdots\text{O}$ and intramolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds pack the ions into chains along [101]. Additional weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ interactions help to influence the twist angles of the mean planes of the benzene rings fused to the azepine ring in the cation. A geometry-optimized MOPAC AM1 theoretical calculation supports these observations.

Trimipraminium maleate

Jerry P. Jasinski, Ray J. Butcher, Q. N. M. Hakim Al-Ariqe, H. S. Yathirajan and B. Narayana

S1. Comment

The title compound is a derivative of trimipramine, chemically, 5-(3-dimethylamino-2-methylpropyl)-10,11-dihydro-5*H*-dibenz(b,f)azepine maleate, a tricyclic antidepressant with sedative and anxiolytic properties and available as stangyl, surmontil, rhotrimine and generic forms. Tricyclic antidepressants are sometimes still used to treat refractory depression that has failed to respond to standard SSRI therapy (Broquet, 1999). Tricyclic antidepressants have been shown to be effective in treating attention-deficit hyperactivity disorder(ADHD) (Biederman *et al.*, 1989). ADHD is thought to be caused by dopamine and norepinephrine shortages in the brain's prefrontal cortex.

Trimipramine is a tricyclic antidepressant of the dibenzazepine class with sedative properties. It also has anticholinergic properties and potentiates the sympathetic response, presumably by blocking the reuptake of norepinephrine which has been released by the presynaptic neurons. It has a quinidine like effect on the heart and an EEG activity similar to that of other tricyclic antidepressants. Trimipramine is a serotonin transport blocker that also blocks norepinephrine uptake. The mechanism of action of trimipramine differs from other tricyclic antidepressants. It is only a moderate reuptake inhibitor of norepinephrine, and a weak reuptake inhibitor of serotonin and dopamine. The spectrum of effects (strong antidepressant activity, sedation and anxiolysis) and side-effects (strong anticholinergic and antiadrenergic side-effects) is the same as with Doxepin. It is also a more effective sedative than amitriptyline. Trimipramine is the only effective drug against insomnia known so far that does not alter the normal sleep architecture.

Trimipramine maleate salt is used in the treatment of depression as well as peptic ulcer and severe chronic pain. A comprehensive description of the title compound is described (Al-Badr, 1983; Lapierre, 1989). The protonation of trimipramine salts of maleate, mesylate and hydrochloride observed by ^1H , ^{13}C and ^{15}N NMR spectroscopy is reported (Somashekar *et al.*, 2004). Also, the PMR spectrometric analysis of trimipramine maleate in pharmaceutical preparation is described (Al-Badr & Ibrahim, 1979). The related crystal structures *viz.*, imipramine hydrochloride (Post *et al.*, 1975), 5-(3-dimethylammonioprop-1-enylidene)-5*H*-dibenzo[a,d]cycloheptene maleate (Jones *et al.*, 1978), desipraminium picrate (Swamy *et al.*, 2007), desipraminium picrate monohydrate (Harrison, Swamy *et al.*, 2007), imipraminium picrate (Harrison, Bindya *et al.*, 2007), amitriptylinium picrate (Bindya *et al.*, 2007), 5-[3-(dimethylamino)propyl]-10,11-dihydro-5*H*-dibenzo[a,d][7]annulen-5-ol (Portalone *et al.*, 2007) have been reported. In view of the importance of the title compound, a crystal structure is reported.

The title compound, $\text{C}_{20}\text{H}_{27}\text{N}_2^+$. $\text{C}_4\text{H}_3\text{O}_4^-$, a maleate salt of trimipramine, crystallizes with four independent cation-anion pairs (E—A, Fig. 1; F—B, Fig. 2; G—C, Fig. 3; H—D, Fig. 4) in the asymmetric unit. Bond lengths and bond angles are all within expected ranges (Allen *et al.* 1987). The Trimipramine cation, $\text{C}_{20}\text{H}_{27}\text{N}_2^+$, contains a seven-membered azepine ring with two fused benzene rings whose mean planes are separated by 51.3 (8) $^\circ$ [E], 51.7 (6) $^\circ$ [F], 49.9 (0) $^\circ$ [G], and 53.9 (0) $^\circ$ [H], respectively. These angles are all less than 57.1(1) $^\circ$ reported for bis((3-(10,11-Dihydro-dibenzo(b,f)azepin-5-yl)-2-methyl-propyl) dimethylammonium) tetrachlorocuprate(ii) (Kamel *et al.* 2001), which contains an identical cation. Intermolecular N—H \cdots O and intramolecular O—H \cdots O hydrogen bonds (Table 1, Fig. 5)

pack the ions into chains along the [101]. Additional weak C—H···O intermolecular interactions (Table 1) help to significantly influence the twist angles of the mean planes of the benzene rings fused to the azepine ring in the cation. After a geometry optimized MOPAC AM1 calculation with WebMO Pro (Schmidt & Polik 2007) on the cation fragment, *in vacuo*, the dihedral angle between the mean planes of the two benzene rings of the azepine group becomes 51.3 (8)°, which is slightly less than the average of the four independent cations (51.7 (1)° but nearly 6° less than that observed in the tetrachlorocuprate (ii) analogue compound. These observations support the suggestion that these intra and intermolecular interactions influence crystal packing in the title compound.

S2. Experimental

The title compound was obtained as a gift sample from *R. L. Fine Chem*, Bangalore, India. The compound was used without further purification. X-ray quality crystals (m.p. 410–412 K) were obtained by slow evaporation from methanol solution.

S3. Refinement

All of the H atoms were placed in their calculated positions and then refined using the riding model with O—H = 0.84 Å, N—H = 0.93 Å, C—H = 0.95–1.00 Å, and with $U_{\text{iso}}(\text{H}) = 1.19\text{--}2.23U_{\text{eq}}(\text{O})$, $U_{\text{iso}}(\text{H}) = 1.18\text{--}1.21_{\text{eq}}(\text{N})$, $U_{\text{iso}}(\text{H}) = 1.18\text{--}1.51U_{\text{eq}}(\text{C})$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
