Received 4 January 2010; accepted 10 January 2010

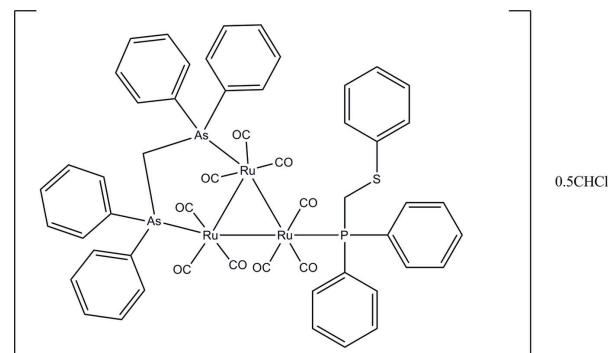

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.009$  Å; disorder in main residue;  $R$  factor = 0.059;  $wR$  factor = 0.158; data-to-parameter ratio = 23.6.

The asymmetric unit of the title *triangulo*-triruthenium cluster,  $[\text{Ru}_3(\text{C}_{25}\text{H}_{22}\text{As}_2)(\text{C}_{19}\text{H}_{17}\text{PS})(\text{CO})_9]\cdot0.5\text{CHCl}_3$ , contains of one molecule of the *triangulo*-triruthenium complex and half a molecule of the disordered (two positions of equal weight) chloroform solvent. The bis(diphenylarsino)methane ligand bridges an Ru–Ru bond and the monodentate phosphine ligand bonds to the third Ru atom. Both the arsine and phosphine ligands are equatorial with respect to the  $\text{Ru}_3$  triangle. In addition, each Ru atom carries one equatorial and two axial terminal carbonyl ligands. The benzene ring of phenylthiomethyl is disordered over two positions with refined site occupancies of 0.788 (11) and 0.212 (11). In the crystal packing, molecules are linked into chains along  $b$  axis by intermolecular C–H···O hydrogen bonds. Weak intermolecular C–H···π interactions further stabilize the crystal structure.

### S1. Comment

*Triangulo*-triruthenium clusters are known for their interesting structural variations and related catalytic activity. A large number of substituted derivatives, Ru<sub>3</sub>(CO)<sub>12-n</sub>L<sub>n</sub> (L = group 15 ligand) have been reported (Bruce *et al.*, 1985, 1988a,b. As part of our study on the substitution of transition metal-carbonyl clusters with mixed-ligand complexes, we have published several structures of *triangulo*-triruthenium-carbonyl clusters containing mixed P/As and P/Sb ligands (Shawkataly *et al.*, 1998, 2004, 2009). Herein we report the synthesis and structure of title compound.

The asymmetric unit consists of one molecule of the *triangulo*-triruthenium complex and half molecule of disordered chloroform solvent (Fig. 1). The bond lengths and angles of title compound are comparable to those found in a related structure (Shawkataly *et al.*, 2009). The bis(diphenylarsino)methane ligand bridges the Ru1—Ru2 bond and the monodentate phosphine ligand bonds to the Ru3 atom. Both the phosphine and arsine ligands are equatorial with respect to the Ru<sub>3</sub> triangle. Additionally, each Ru atom carries one equatorial and two axial terminal carbonyl ligands. The phosphine-substituted benzene rings (C26—C31/C39—C44 and C32—C37/C39—C44) make dihedral angles of 51.1 (5) and 57.8 (5)° with the benzene ring of phenylthiomethyl residue for the major component whereas these values are 42 (2) and 67 (2)° for the minor component. The dihedral angles between the two benzene rings (C1—C6/C7—C12 and C14—C19/C20—C25) are 78.7 (3) and 76.8 (3)° for the two diphenylarsino groups respectively.

In the crystal packing (Fig. 2), the molecules are linked into chains along *b* axis by intermolecular C18—H18A···O1 and C29—H29A···O3 contacts. Weak intermolecular C—H··· $\pi$  interactions further stabilize the crystal structure (Table 1).

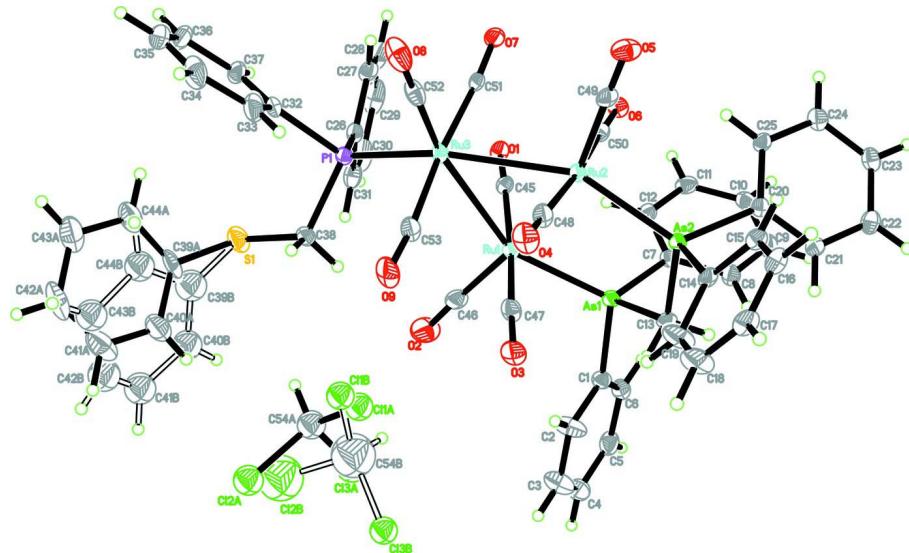

### S2. Experimental

All manipulations were performed under a dry, oxygen-free dinitrogen atmosphere using standard Schlenk techniques. All solvents were dried over sodium and distilled from sodium benzophenone ketyl under nitrogen. Diphenyl(phenylthiomethyl)phosphine (Sanger, 1983) was used as received and  $\mu$ -bis(diphenylarsino)methane-decacarbonyl-triruthenium(0) was prepared by a reported procedure (Bruce *et al.*, 1983). The title compound was obtained by refluxing equimolar quantities of Ru<sub>3</sub>(CO)<sub>10</sub>( $\mu$ -Ph<sub>2</sub>AsCH<sub>2</sub>AsPh<sub>2</sub>) (105.5 mg, 0.1 mmol) and diphenyl(phenylthiomethyl)phosphine (30.84 mg, 0.1 mmol) in hexane under a nitrogen atmosphere. Crystals were grown by slow solvent / solvent diffusion of C<sub>6</sub>H<sub>14</sub> into CHCl<sub>3</sub>.

### S3. Refinement

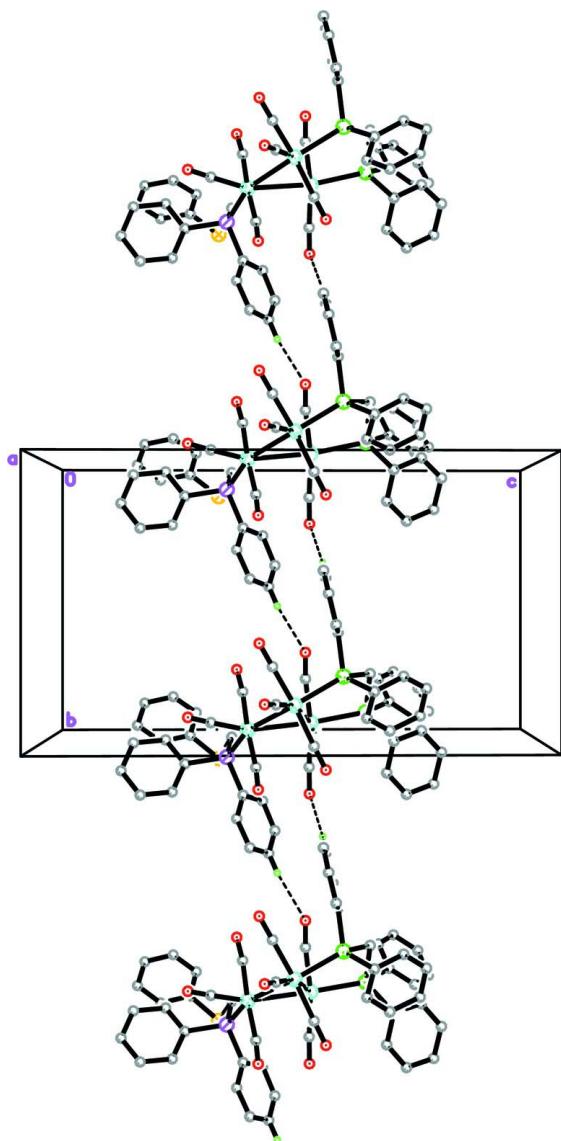

All hydrogen atoms were positioned geometrically and refined using a riding model with C—H = 0.93–0.97 Å and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ . The C39—C44 ring and the chloroform molecule are disordered over two positions. The benzene ring has refined site occupancies of 0.788 (11) and 0.212 (11) for C39—C44 ring whereas site occupancies of the chloroform

molecule are fixed to 0.25 for both components at final refinement. The same  $U_{ij}$  parameters were used for the atom pairs Cl1B/Cl3B, Cl1B/Cl1A and C41B/C39B. The disordered atoms of the ring were subjected to rigid bond and similarity restraints and the minor component is refined isotropically. The chloroform atoms were only subjected to rigid bond restraint and both components are refined isotropically. The maximum and minimum residual electron density peaks of 1.78 and -3.30 e Å<sup>-3</sup>, respectively, were located 0.77 Å and 0.07 Å from the Cl2B and Cl3B atoms, respectively.

**Figure 1**

The molecular structure of the title compound with 30% probability ellipsoids for non-H atoms. All disordered components are shown.

**Figure 2**

The crystal packing of the title compound, viewed down the *a* axis, showing the molecules linked into a chain along *b* axis by C–H···O contacts (dashed lines); the remaining H atoms and the solvent molecules have been deleted for reasons of clarity. Only major disordered component is shown.

*Special details*

**Experimental.** The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg1, Cg2 and Cg3 are the centroids of the C39A—C44A, C14—C19 and C32—C37benzene rings, respectively.
