Received 23 February 2010; accepted 6 March 2010

Key indicators: single-crystal X-ray study; $T = 148$ K; mean $\sigma(\text{Mo}=\text{O}) = 0.003$ Å; disorder in solvent or counterion; R factor = 0.021; wR factor = 0.056; data-to-parameter ratio = 13.3.

Previously reported at a temperature of 298 (2) K [Lee & Joo (2007). *Acta Cryst. E63*, i11–i13], the title compound, $\text{K}_7[\text{H}_9\alpha\text{-PtMo}_{12}\text{O}_{48}]\cdot 11\text{H}_2\text{O}$ or $\text{K}_7[\text{H}_{4.5}\alpha\text{-PtMo}_6\text{O}_{24}]_2\cdot 11\text{H}_2\text{O}$, was redetermined at 146 (2) K in order to determine whether the H atom in the hydrogen bond that crosses the center of symmetry was located at the center of symmetry or disordered around it as assumed in the previous study. During the present low-temperature study it was found on the center of symmetry. One water molecule shows half-occupancy.

Redetermination of heptapotassium nonahydrogen bis[α -hexamolybdoplatinate(IV)] undecahydrate

Uk Lee, Hea-Chung Joo and Ki-Min Park

S1. Comment

The α - β - α geometrical isomerization according to the stepwise protonation in the $[\text{PtMo}_6\text{O}_{24}]^{8-}$ polyoxometalate species is very unusual phenomenon, viz., $([\text{H}_{3.5}\alpha\text{-PtMo}_6\text{O}_{24}])^{4.5-}$ (Lee & Sasaki, 1994), $[\text{H}_4\beta\text{-PtMo}_6\text{O}_{24}]^4$ (Lee & Sasaki, 1994; Joo *et al.*, 1994) and $[\text{H}_{4.5}\alpha\text{-PtMo}_6\text{O}_{24}]^{3.5-}$ (Lee & Sasaki, 1994; Lee & Joo, 2007).

This study was carried out to identify the position of the hydrogen atom that lies close to the center of symmetry. The structure of the title compound has been discussed in detail (Lee & Joo, 2007). Fig. 1 shows the structure of the polyanion. The O atoms of the clusters were designated as O_t (terminal Mo=O atom), O_b (O bridged μ_2 -O atom), and O_c (μ_3 -O atom). The protonated O atoms in the polyanion were identified by the location in difference Fourier maps of the H atoms bound to O atoms and local structural features as seen previously (Lee & Joo, 2006a,b and Table 1). Fig. 2 shows a symmetrical electron density map around H6 atom. The position of H6 is (1/2, 0, 1/2). The distance of O_{6c}–H6 and O_{6c}···O_{6c}ⁱ are 1.28 Å and 2.553 (5) Å, and the bond angle of O_{6c}–H6–O_{6c}ⁱ is 180 ° (Table 1 & Fig. 3).

The position of H6 was not found on the difference map in the previous report (Lee & Joo, 2007). Therefore the H atom was considered as having positional disorder. The K₂ ion is located on the inversion center. As a result the number of K⁺ ion is 7 and H⁺ ion is 9 in the unit cell.

The K⁺ ions are variously coordinated by O atoms as $[\text{K}_1(\text{O}_b)(\text{O}_t)_2(\text{O}_w)_4]^+$, $[\text{K}_2(\text{O}_b)_2(\text{O}_t)_6]^+$, $[\text{K}_3(\text{O}_b)(\text{O}_t)_5(\text{O}_w)_2]^+$, and $[\text{K}_4(\text{O}_t)_5(\text{O}_w)_2]^+$, respectively.

S2. Experimental

Crystals of title compound were prepared by the reaction of K₂MoO₄·2H₂O and K₂Pt(OH)₆ at pH 2.85 as described in a previous report (Lee & Sasaki, 1994).

S3. Refinement

All H atoms in the polyanion were positioned in a difference Fourier maps and refined freely except H2 and H3. H2 and H3 refined with a distances restraint of O–H = 0.85 (3) Å. The H atoms of all O_w water molecules were placed in calculated positions with a distances restraint of O–H = 0.85 (3) Å. Their displacement parameters were freely refined except the O_{6w} water molecule. The reasonable thermal ellipsoid of O_{6w} was obtained by half occupancy. The H atoms of O_{6w} were included in the refinement with $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{O})$.

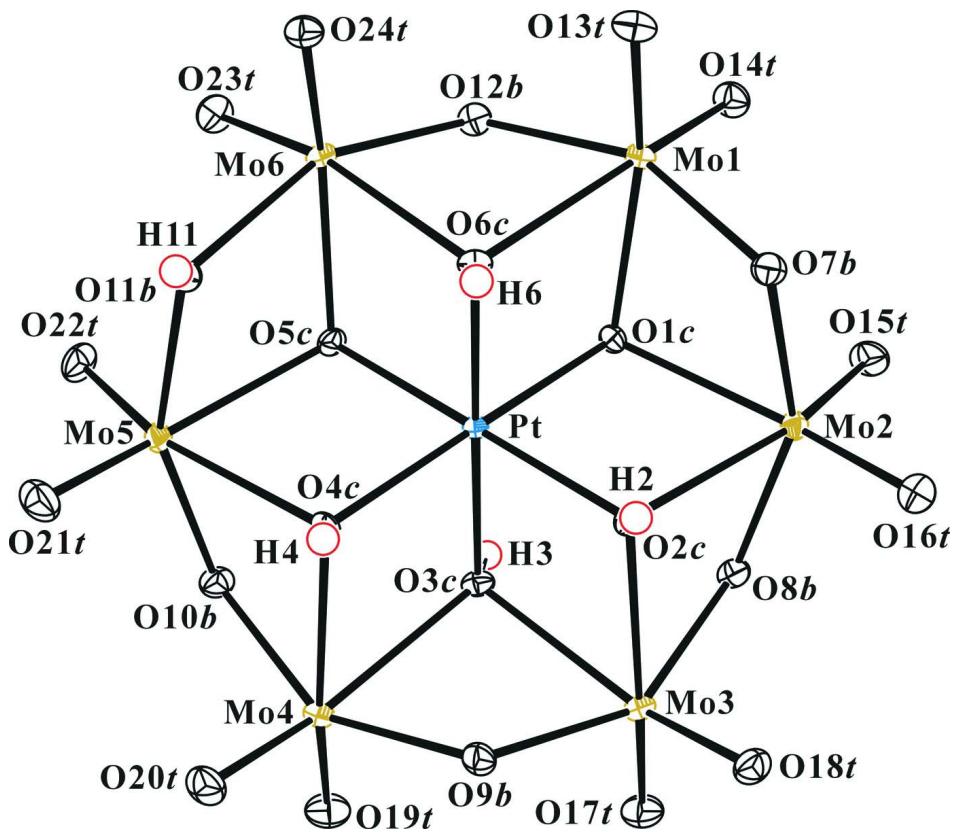

Figure 1

The polyanion structure in the title compound. Displacement ellipsoids are drawn at the 50 % probability level for non-H atoms. H atoms are presented as a small spheres of arbitrary radius.

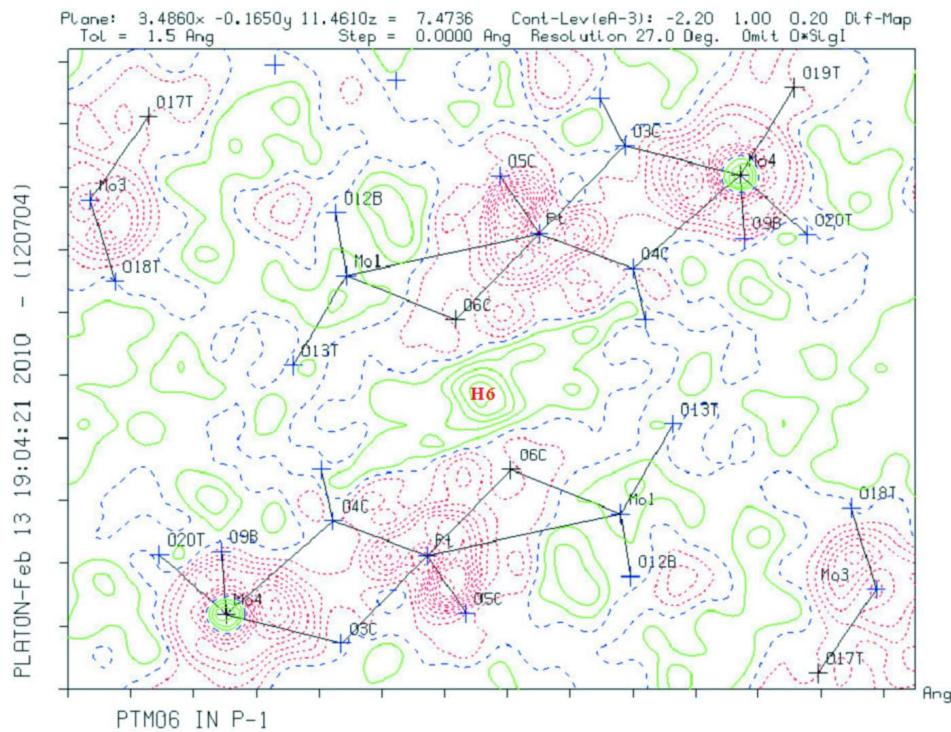

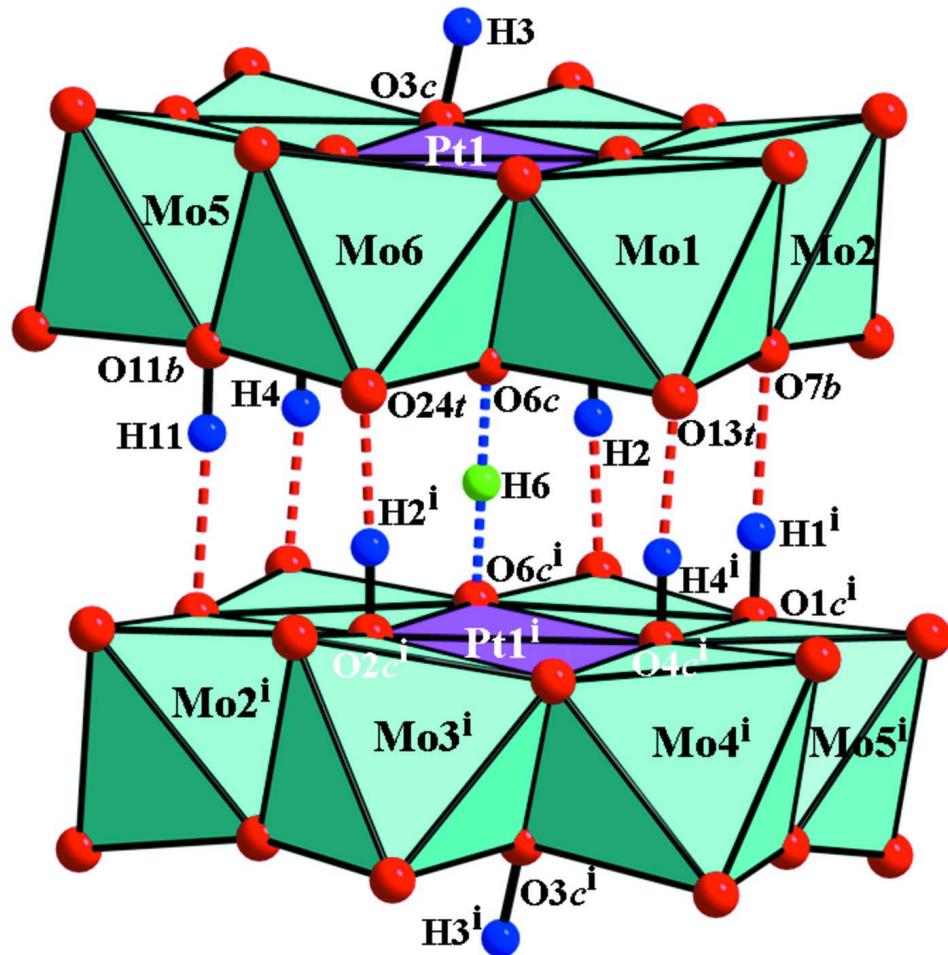

Figure 2

Difference Fourier map around H6 atom where atom H6 is absent.

**Figure 3**

 $\Delta\rho_{\min} = -2.50 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
