

**2-Amino-4-methylpyridinium trifluoroacetate****Madhukar Hemamalini and Hoong-Kun Fun\***‡X-ray Crystallography Unit, School of Physics, Universiti Sains Malaysia, 11800 USM, Penang, Malaysia  
Correspondence e-mail: hkfun@usm.my

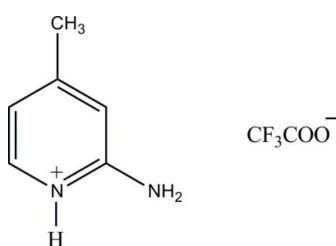

Received 19 February 2010; accepted 3 March 2010

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.070;  $wR$  factor = 0.187; data-to-parameter ratio = 16.3.

The asymmetric unit of the title compound,  $\text{C}_6\text{H}_9\text{N}_2^+\cdot\text{C}_2\text{F}_3\text{O}_2^-$ , contains two independent 2-amino-4-methylpyridinium cations and two independent trifluoroacetate anions. The F atoms of both anions are disordered over two sets of sites, with site occupancies of 0.50 (3) and 0.50 (3) in one of the anions, and 0.756 (9) and 0.244 (9) in the other. In the crystal, the cations and anions are linked into chains along the  $b$  axis by  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds and these chains are cross-linked by  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds, forming a two-dimensional network lying parallel to (101). The crystal structure is further stabilized by  $\pi-\pi$  interactions between the pyridinium rings [centroid–centroid distances = 3.5842 (13) and 3.5665 (16)  $\text{\AA}$ ].

## 2-Amino-4-methylpyridinium trifluoroacetate

Madhukar Hemamalini and Hoong-Kun Fun

### S1. Comment

Pyridine and its derivatives play an important role in heterocyclic chemistry (Pozharski *et al.*, 1997; Katritzky *et al.*, 1996). They are often involved in hydrogen-bond interactions (Jeffrey & Saenger, 1991; Jeffrey, 1997; Scheiner, 1997). Trifluoroacetic acid (TFA) is a very strong carboxylic acid, easily volatile, and used for protein purifications. Several trifluoroacetate salts and their crystal structures have been reported (Rodrigues *et al.*, 2001). The crystal structures of 2-amino-4-methylpyridine (Kwick & Noordik, 1977), 2-amino-4-methylpyridinium 4-aminobenzoate (Shen *et al.*, 2008) have also been reported. We have recently reported the crystal structure of 2-amino-4-methylpyridinium 4-nitrobenzoate (Hemamalini & Fun, 2010). In continuation of our studies of pyridinium derivatives, the crystal structure determination of the title compound has been undertaken.

The asymmetric unit of the title compound consists of two crystallographically independent 2-amino-4-methylpyridinium cations (A and B) and two trifluoroacetate anions (A and B) (Fig. 1). Each 2-amino-4-methylpyridinium cation is planar, with a maximum deviation of 0.007 (3) Å for atom C6A in cation A and 0.011 (5) Å for atom C6B in cation B. The protonation of atoms N1A and N1B lead to a slight increase in C1A—N1A—C5A [122.3 (2)°] and C1B—N1B—C5B [121.7 (2)°] angles.

In the crystal packing (Fig. 2), the A (and B)-type 2-amino-4-methylpyridinium cations interact with the carboxylate groups of A (and B)-type trifluoroacetate anions through a pair of N—H···O hydrogen bonds, forming an  $R_2^2(8)$  motif (Bernstein *et al.*, 1995). The cation-anion pairs are linked into a chain along the *b* axis by N—H···O hydrogen bonds. The crystal structure is further stabilized by C—H···O (Table 1) hydrogen bonds and  $\pi$ – $\pi$  interactions involving the N1A/C1A—C5A and N1A/C1A—C5A pyridine rings [centroid-to-centroid separation = 3.5842 (13) Å], and N1B/C1B—C5B and N1B/C1B—C5B rings [centroid-to-centroid separation = 3.5665 (16) Å].

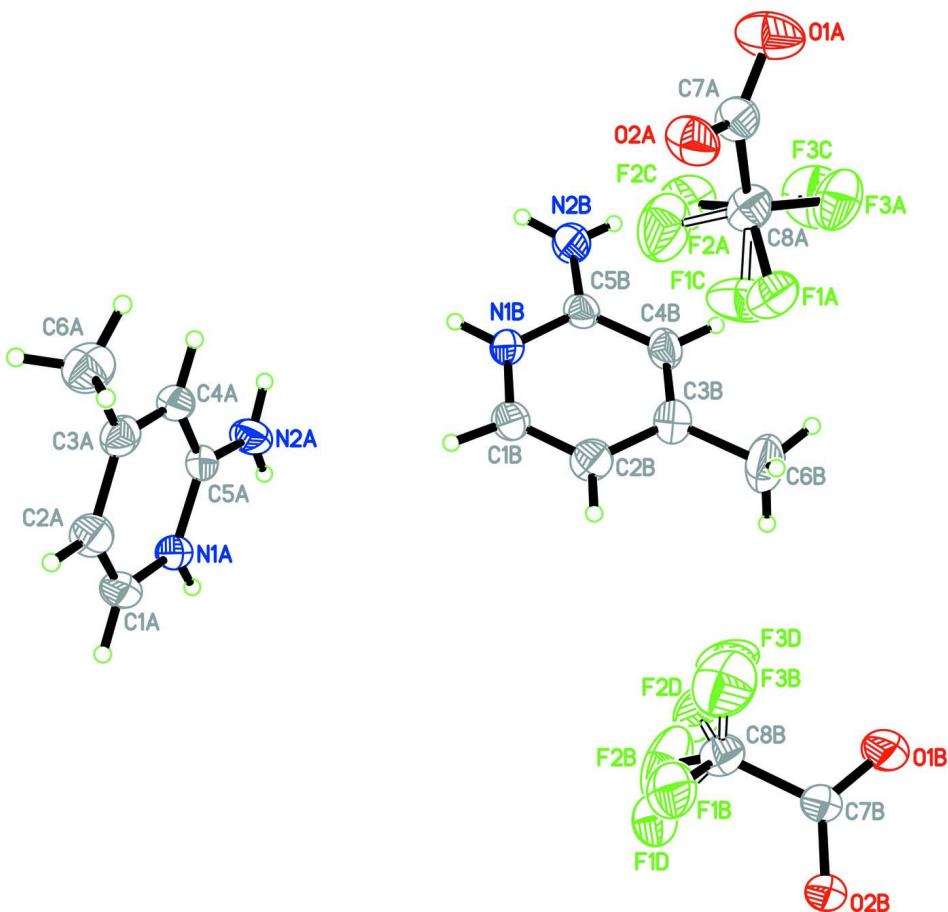

### S2. Experimental

To a hot methanol solution (20 ml) of 2-amino-4-methylpyridine (27 mg, Aldrich) was added a few drops of trifluoroacetic acid. The solution was warmed over a water bath for a few minutes. The resulting solution was allowed to cool slowly to room temperature. Crystals of the title compound appeared after a few days.

### S3. Refinement

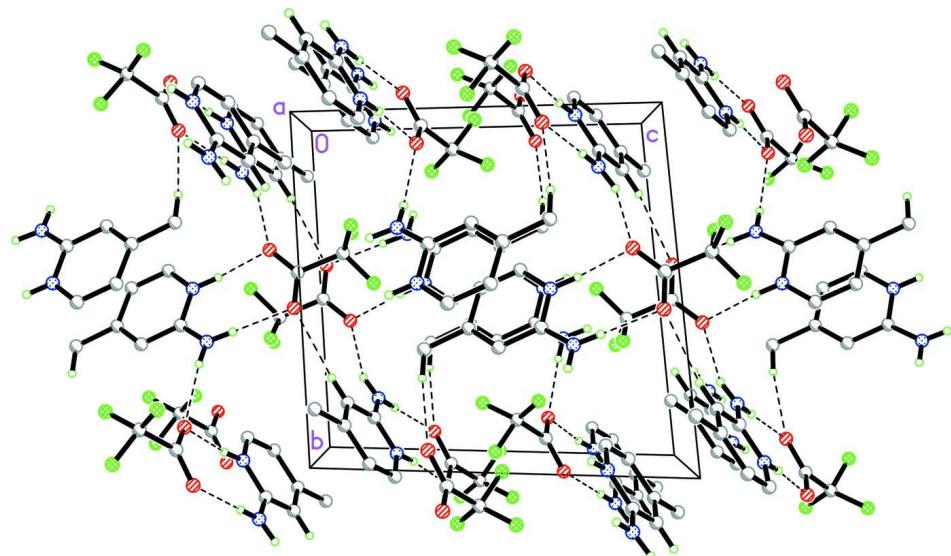

Atoms H1NA, H2NA, H3NA, H1NB, H2NB and H3NB were located in a difference Fourier map and refined; the N—H distances of the NH<sub>2</sub> groups were restrained to be equal. The remaining H atoms were positioned geometrically [C—H = 0.93 or 0.96 Å] and were refined using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2$  or 1.5  $U_{\text{eq}}(\text{C})$ . A rotating group model was applied to the methyl groups. The F atoms of both anions are disordered over two positions, with site occupancies of 0.50 (3) and 0.50 (3) in one of the anions, and 0.756 (9) and 0.244 (9) in the other anion. In each anion, the C—F distances were restrained to be equal and the  $U^{ij}$  components of F atoms were restrained to an approximate isotropic

behaviour.

**Figure 1**

The asymmetric unit of the title compound. Displacement ellipsoids are drawn at the 30% probability level. All disorder components are shown.

**Figure 2**

The crystal packing of the title compound, showing the hydrogen-bonded (dashed lines) network.

where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.25 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.26 \text{ e } \text{\AA}^{-3}$

#### Special details

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
