Received 15 May 2010; accepted 25 May 2010

Key indicators: single-crystal X-ray study;  $T = 295$  K; mean  $\sigma(C-C) = 0.003$  Å;  $R$  factor = 0.040;  $wR$  factor = 0.098; data-to-parameter ratio = 11.1.

The structure of the title compound,  $C_{19}H_{28}O_2$ , has been redetermined at 295 (2) K, with much improved precision. The structure and molecular packing of the title compound was first reported by Coiro *et al.* [Acta Cryst. (1973). B29, 1404–1409] by means of potential-energy calculations. The cell parameters in this study differ considerably in space group  $C2$ . It is a derivative of testosterone and consists of a cyclopentanone ring (*A*) fused to successive cyclohexane (*B* and *C*) and cyclohexanone (*D*) rings. The three cyclohexanone rings are in slightly distorted boat configurations and the cyclopentanone ring is a distorted half-chair. The crystal packing is stabilized by weak intermolecular C–H···O interactions involving O atoms from each of the cyclohexanone and cyclopentanone rings and H atoms from each of their respective rings.

## Redetermination of 5 $\alpha$ -androstane-3,17-dione

**Jerry P. Jasinski, Ray J. Butcher, Q. N. M. Hakim Al-arique, H. S. Yathirajan and B. Narayana**

### S1. Comment

The title compound, C<sub>19</sub>H<sub>28</sub>O<sub>2</sub> (systematic iupac name: (8R,9S,10R,13S,14S)-10,13-Di-methyl-1,2,4,5,6,7,8,9,11,12,14,15,16-tridecahydrocyclopenta[*a*]phenanthrane-3,17-dione or dodecahydro-10,13-di-methyl-2*H*-cyclopenta[*a*]phenanthrene-3,17(4*H*,14*H*)-dione) is a derivative of testosterone. The crystal structure of the title compound (CSD code: ANDION10) was first reported by Coiro *et al.* (1973) with cell parameters of  $a = 12.700$  (20);  $b = 6.190$  (10);  $c = 21.340$  (30) Å;  $c = 91.27$  (10) $^\circ$  and an *R*-factor of 12% at  $T = 295$  K. These values coincide with those reported earlier (Ohrt *et al.*, 1965). However in the present investigations, the cell parameters are  $a = 12.7786$  (6);  $b = 6.7850$  (4);  $c = 19.6242$  (10) Å and  $\beta = 106.444$  (5) $^\circ$  with an *R*-factor of 3.86% at 295 K. The crystal structure of 5 $\beta$ -androstane-3,17-dione is already reported (Norton *et al.*, 1962; Anthony *et al.*, 1998). The biotransformation of 5 $\alpha$ -androstane-3,17-dione by microalgal cultures is reported (Fiorentino *et al.*, 1991). We have recently reported the crystal structure of 3-oxo-4-aza-5-alpha-androstone-17*b*-*tert*-butyl carboxamide (Jasinski *et al.*, 2009). In view of the importance of steroids and taking into account the importance of the title compound, this paper reports the redetermination of its crystal structure with an improved precision.

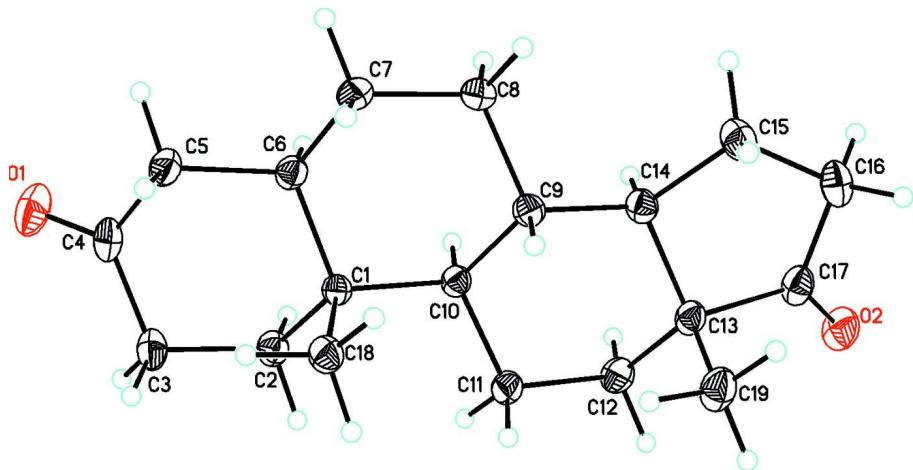

The title compound, C<sub>19</sub>H<sub>28</sub>O<sub>2</sub>, consists of a cyclopentanone ring (A) fused to successive cyclohexane (B & C) and cyclohexanone (D) rings. The three cyclohexanone rings are in slightly distorted chair configurations with Cremer & Pople (1975) puckering parameters Q,  $\theta$  and  $\varphi$  of 0.530 (2) Å, 9.5 (2) $^\circ$  & 3.5 (13) $^\circ$ , for A, 0.5778 (19) Å, 5.77 (19) $^\circ$  & 344.7 (19) $^\circ$ , for B, and 0.5697 (19) Å, 173.01 (19) $^\circ$  & 65.5 (16) $^\circ$ , for C, respectively (Fig. 1). For an ideal chair  $\theta$  has a value of 0 or 180 $^\circ$ . The cyclopentanone ring is a distorted half-chair, phi(2) = 22.5 (3) $^\circ$ . For an ideal half-chair, phi(2) =  $k \times 36 + 18$ . The crystal packing is stabilized by weak intermolecular C—H···O interactions between a hydrogen atom from the cyclohexanone ring (H5A) with an oxygen atom from a nearby cyclohexanone ring (O1) and between a hydrogen atom from the cyclopentanone ring (H16A) with an oxygen atom from a nearby cyclopentanone ring (O2), respectively (Fig. 2, Table 1).

### S2. Experimental

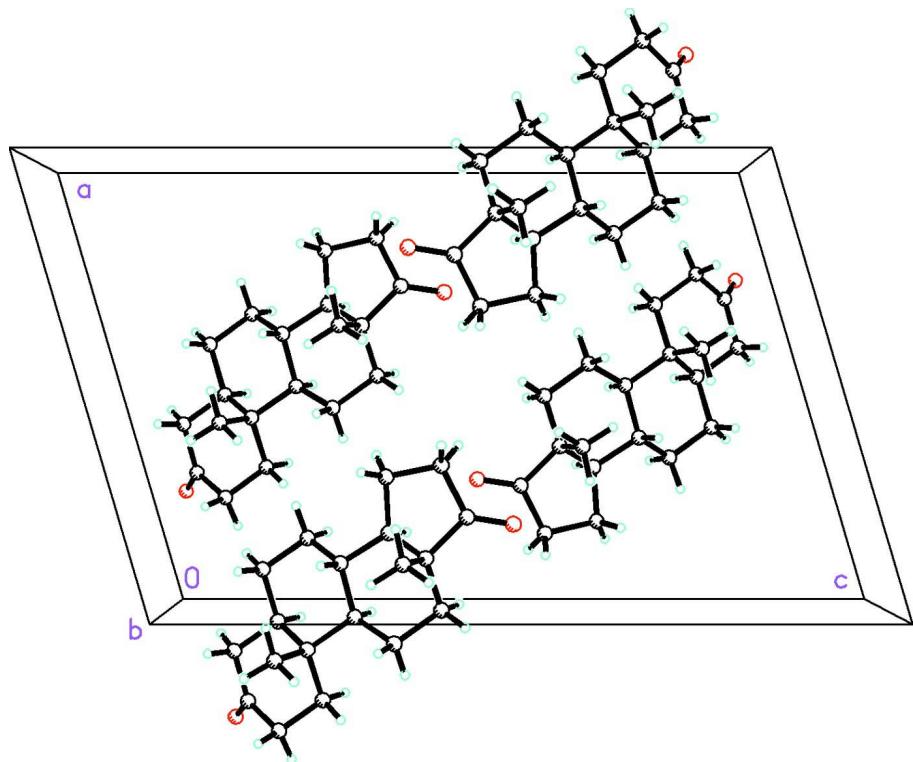

The title compound was obtained as a gift sample from R. L. Fine Chem., Bangalore, India. The compound was used without further purification. X-ray quality crystals were obtained from slow evaporation of acetone solution (m.p.: 373–375 K).

### S3. Refinement

All of the H atoms were placed in their calculated positions and then refined using the riding model with C—H = 0.96–0.98 Å, and with  $U_{\text{iso}}(\text{H}) = 1.18\text{--}1.50U_{\text{eq}}(\text{C})$ .

**Figure 1**

 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.16 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\min} = -0.12 \text{ e \AA}^{-3}$

*Special details*

**Experimental.** In the absence of anomalous scattering effects Friedel opposites were merged.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
