Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(C-C) = 0.003$  Å;  $R$  factor = 0.024;  $wR$  factor = 0.060; data-to-parameter ratio = 16.7.

The title polymer,  $[Zn_3(C_8H_8O_5)_2(C_3H_3N_2)_2(C_3H_4N_2)_2]_n$ , was formed by the reaction of zinc acetate with imidazole and 7-oxabicyclo[2.2.1]heptane-2,3-dicarboxylic anhydride (norcantharidine). One of the two crystallographically unique  $Zn^{II}$  atoms is four-coordinated by three N atoms of three imidazole ligands, two of which are deprotonated, and by one carboxylate O atom of the demethylcantharate anion. The second  $Zn^{II}$  atom is situated on an inversion centre and is six-coordinated by the bridging O atoms of two symmetry-related demethylcantharate anions and by four carboxylate O atoms of the corresponding carboxylate groups. The polymeric crystal structure is additionally stabilized by N–H···O hydrogen bonding between the imidazole ligands and carboxylate O atoms.

### Related literature

7-Oxabicyclo[2.2.1]heptane-2,3-dicarboxylic anhydride (norcantharin) is a lower toxicity anticancer drug, see: Shimi *et al.* (1982). For cobalt complexes of norcantharin, see: Wang *et al.* (1988) and for those including imidazole ligands, see: Furenlid *et al.* (1986); Zhu *et al.* (2003).

### S1. Comment

7-oxabicyclo[2.2.1] heptane-2,3-dicarboxylic anhydride (norcantharinidin) derived from cantharinidin is a lower toxicity anticancer drug (Shimi *et al.*, 1982). Imidazole is reputed as biocatalyst and biological ligand. Several cobalt complexes of norcantharinidin (Wang *et al.*, 1988) and of imidazole (Furenlid *et al.*, 1986; Zhu *et al.*, 2003) have been reported previously.

In the structure of the title compound, the Zn1(II) cation is four-coordinated by three nitrogen atoms of three imidazoles ligands, two of which are deprotonated, and by one carboxylate oxygen atom of the demethylcantharate anion. The deprotonated imidazole rings are responsible for bridging neighbouring Zn1 atoms. The Zn2(II) cation is located on a crystallographic centre of inversion. Two bridge oxygen atoms of two symmetry-related demethylcantharate anions and four carboxylate oxygen atoms give rise to a slightly distorted octahedral ZnO<sub>6</sub> coordination environment. Each de-methylcantharate anion adopts simultaneously a bridging coordination mode (O2 towards Zn1, O4 towards Zn2) and a monodentate coordination mode (through O5 towards Zn2).

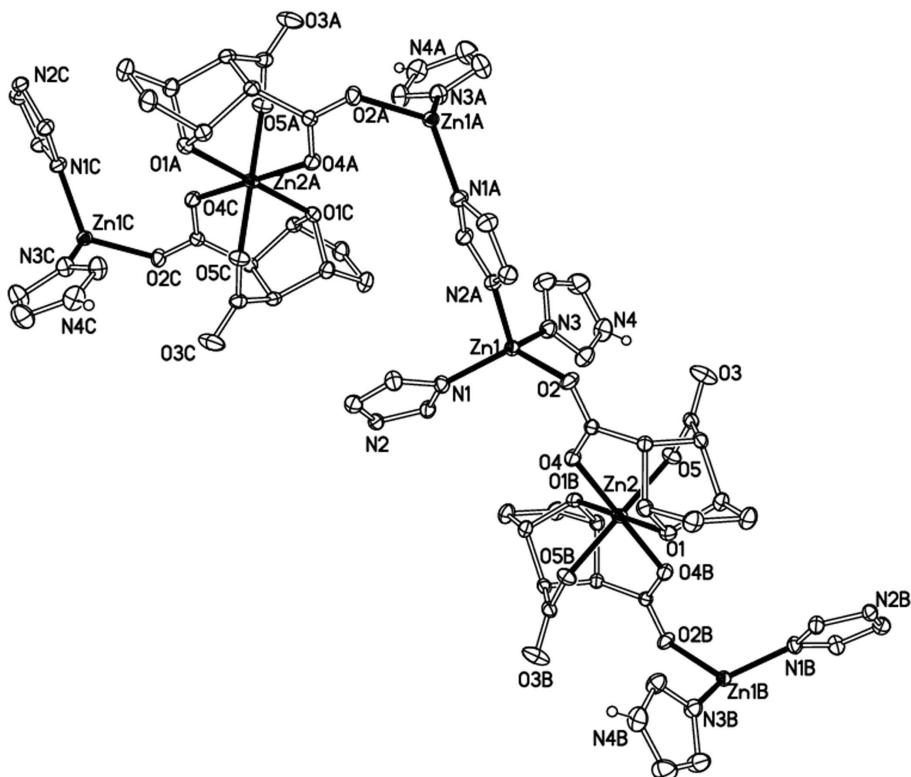

The crystal lattice is stabilized through N—H···O hydrogen bonds between the uncoordinated nitrogen atom (N4) of the imidazole molecule and one of the carboxylate oxygen atoms (O3) of the demethylcantharate anion.

### S2. Experimental

7-oxabicyclo[2.2.1] heptane-2,3-dicarboxylic anhydride, zinc acetate and imidazole were dissolved in 15 mL distilled water. The mixture was sealed in a 25 mL Teflon-lined stainless vessel and heated at 443 K for 3 d, then cooled slowly to room temperature. Crystals suitable for X-ray diffraction were obtained.

### S3. Refinement

The H atoms bonded to C and N atoms were positioned geometrically and refined using a riding model [aromatic C—H = 0.93 Å, aliphatic C—H = 0.97 (2) Å and N—H = 0.86 Å with U<sub>iso</sub>(H) = 1.2U<sub>eq</sub>(C,N)].

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor wR and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
