Received 10 June 2010; accepted 24 June 2010

Key indicators: single-crystal X-ray study; $T = 200\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.051; wR factor = 0.153; data-to-parameter ratio = 12.2.

In the structure of the title salt, $\text{C}_{12}\text{H}_{10}\text{N}_3\text{O}_4^+\cdot\text{C}_7\text{H}_3\text{N}_2\text{O}_7^-$, the cations and the anions are linked by a single $\text{N}^+-\text{H}\cdots\text{O}_{\text{carboxyl}}$ hydrogen bond, the discrete cation–anion unit having no intermolecular associations other than weak cation–anion aromatic ring $\pi-\pi$ interactions [ring centroid separation = 3.7320 (14) \AA] and a number of weak inter-unit aromatic C–H \cdots O contacts. An intramolecular C–H \cdots O hydroxyl–carboxyl hydrogen bond occurs in the anion.

2-(2,4-Dinitrobenzyl)pyridinium 2-hydroxy-3,5-dinitrobenzoate

Graham Smith, Urs D. Wermuth and David J. Young

S1. Comment

The Lewis base 2-(2,4-dinitrobenzyl)pyridine (DNBP) is unusual because of its photochromic properties, undergoing a reversible solid-state colour change from colourless to deep blue on irradiation with light of wavelength 400 nm or less. This is due to two-photon excitation giving nitro-assisted proton transfer (NAPT) involving an oxygen of the *o*-nitro substituent group and the pyridine N atom (Naumov *et al.*, 2002). The structures of both the colourless form (Seff & Trueblood, 1968; Scherl *et al.*, 1996) and the blue form (Naumov *et al.*, 2002), have been determined as well, as that of the chloride (Naumov *et al.*, 2005).

Our reaction of DNBP with a number of aromatic carboxylic and sulfonic acids in aqueous ethanol has previously provided only one crystalline compound: bis[2-(2,4-dinitrobenzyl)pyridinium] biphenyl-4,4'-disulfonate trihydrate, for which the structure was reported (Smith, Wermuth & Young, 2010). A second crystalline compound was subsequently obtained from the reaction of DNBP with 3,5-dinitrosalicylic acid (DNSA), the title compound anhydrous $C_{12}H_{10}N_3O_4^+ \cdot C_7H_3N_2O_7^-$ (I), the structure of which is reported here. DNSA has been very useful as an acid capable of producing crystalline salts with a range of both aliphatic and aromatic Lewis bases and the structures of a large number of these are reported in the crystallographic literature, *e.g.* Smith *et al.* (2002, 2003, 2007) and Smith, Cotton *et al.* (2010).

With compound (I) (Fig. 1), a single cation–anion $N^+-H\cdots O_{\text{carboxyl}}$ hydrogen bond together with a weak aliphatic $C-H\cdots O_{\text{carboxyl}}$ association ($C71-H\cdots O11A$) (Table 1), form discrete cation–anion units. These units have no intermolecular interactions other than mostly weak aromatic $C-H\cdots O$ contacts [one is strong: $C6-H\cdots O31A^{iii}$: symmetry code (iii), $-x + 1, -y + 1, -z + 1$], and also weak cation–anion $\pi-\pi$ aromatic ring associations [ring centroid separation for $C11-C61$ to $C1A-C6A$, 3.7320 (14) Å] down the *a* axial direction (Fig. 2).

With the DNBP cation both nitro groups are rotated out of the plane of the benzene ring [torsion angles $C11-C21-N21-O22, -151.4$ (2)° and $C31-C41-N41-O42, 149.9$ (2)°]. In the DNSA anion, within the intramolecular hydroxyl–carboxyl hydrogen bond, the H atom is located on the hydroxyl group rather than being *anti*-related on the carboxyl group. (I) is only one of the *ca* 30% of the known examples of DNSA salts having this (Smith *et al.*, 2007). The carboxyl group, as expected, is close to planar with the benzene ring [torsion angle $C2A-C1A-C11A-O11A, 175.0$ (2)°], while one nitro group is close to coplanar [torsion angle $C4A-C5A-C51A-O52A, 177.6$ (2)°], the other being rotated out of the plane [torsion angle $C2A-C3A-C31A-O32A, -159.1$ (2)°]. In the structure there is a short nonbonded contact across an inversion centre [$O42\cdots O42^{iv}, 2.897$ (3) Å: symmetry code (iv) $-x + 1, -y, -z + 1$], this O atom being associated with the large electron density maximum (0.75 e Å⁻³).

S2. Experimental

The title compound was synthesized by heating together under reflux for 10 minutes, 1 mmol quantities of 2-(2,4-dinitrobenzyl)pyridine and 3,5-dinitrosalicylic acid in 50 ml of 50% ethanol–water. After concentration to *ca* 30 ml, partial room

temperature evaporation of the hot-filtered solution gave yellow plates (m.p. 383 K) having 90° yellow–colourless orientational dichroism in the crystals.

S3. Refinement

The two hydrogen atoms involved in hydrogen-bonding interactions were located by difference methods and were constrained in the refinement with the other H atoms at calculated positions [C–H = 0.93 Å (aromatic) and 0.97 Å (aliphatic)] and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$, using a riding-model approximation. There is a larger than normal maximum residual electron density peak (0.75 e Å⁻³) which is located *ca* 1.56 Å from the nitro O atom O42).

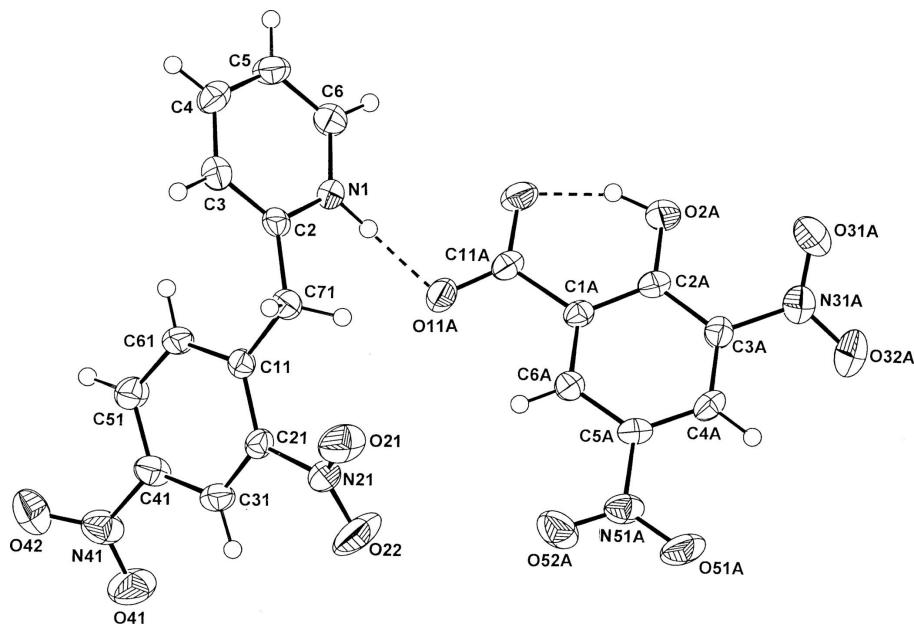

Figure 1

Molecular configuration and atom naming scheme for the DNBP cation and the DNSA anion in the asymmetric unit of (I), with the hydrogen bonds shown as a dashed lines. Displacement ellipsoids are drawn at the 50% probability level.

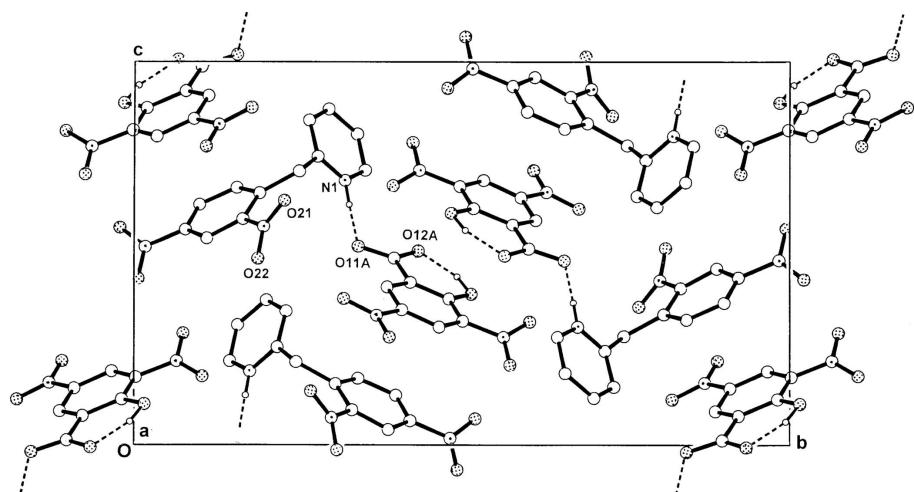

Figure 2

The packing of the cation–anion pairs in the unit cell viewed down the *a* cell direction. Non-interactive H atoms are omitted.

 $\Delta\rho_{\max} = 0.75$ e Å⁻³
 $\Delta\rho_{\min} = -0.32$ e Å⁻³

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
