Received 16 June 2010; accepted 12 July 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.037; wR factor = 0.102; data-to-parameter ratio = 10.9.

A new monoclinic form of the title compound, $\text{C}_{14}\text{H}_{17}\text{N}_3\text{O}_3\text{S}$, has been found upon slow crystallization from water. Another monoclinic form of the compound was obtained previously from a mixture of dichloromethane and diethyl ether [Clerici *et al.* (2002). *Tetrahedron*, **58**, 5173–5178]. Both phases crystallize in space group $P2_1/n$ with one molecule in the asymmetric unit. The formally single exocyclic C–N bond that connects the $-\text{NEt}_2$ unit with the thiazete ring is considerably shorter than the adjacent, formally double, endocyclic C≡N bond. This is likely to be due to the extended conjugated system between the electron-donor diethylammine fragment and the electron-withdrawing sulfonyl group. In the newly discovered polymorph, the methoxy group is rotated by almost 180° around the phenyl– OCH_3 bond, resulting in a different molecular conformation.

Related literature

Thanks are due to Professor Riccardo Destro (Università degli Studi di Milano) for thoughtful discussions and to Professor Francesca Clerici (Università degli Studi di Milano) for providing the crystal. Dr Laura Loconte (Università degli Studi di Milano) and Mr Pietro Colombo (Consiglio Nazionale delle Ricerche) are also to be thanked for technical assistance. Financial support by the Italian MIUR (fondi PUR 2008) is also gratefully appreciated.

Supplementary data and figures for this paper are available from the IUCr electronic archives (Reference: NK2045).

A new monoclinic polymorph of 3-diethylamino-4-(4-methoxyphenyl)-1,1-dioxo-4*H*-1*λ*⁶,2-thiazete-4-carbonitrile

Ahmed M. Orlando, Leonardo Lo Presti and Raffaella Soave

S1. Comment

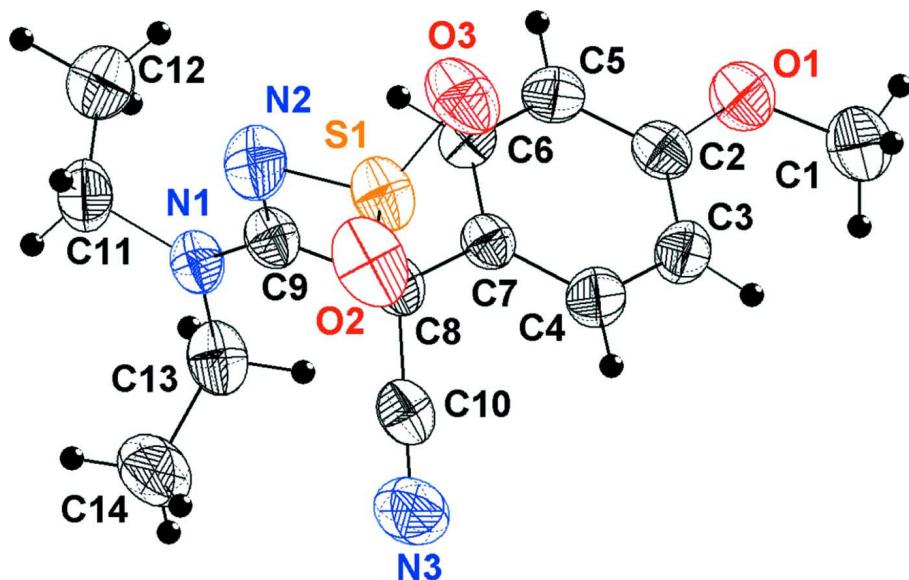

The title compound, (I), a thiazete 1,1 dioxo derivative containing a four-membered heterocycle, exhibits a marked similarity with the β -sultamic functionality, which is the key component of promising antibiotic drugs (Barwick *et al.*, 2008). A new monoclinic polymorph of (I) (hereinafter, phase B; Fig. 1, Table 1) was found upon slow recrystallization from water of a little amount of the phase A, originally obtained from a $\text{CH}_2\text{Cl}_2:\text{Et}_2\text{O}$ mixture (Clerici *et al.*, 2002). Both polymorphs share the same space group, $P2_1/n$, with one molecule in the asymmetric unit. On average, bond lengths and angles are very similar between the two forms, while the molecular conformations are different. The most important dissimilarity resides in the dihedral angles involving the phenyl-OCH₃ single bond, which is rotated by $\sim 180^\circ$ in the form B with respect to form A (Fig. 2). In both crystal forms the formally single exocyclic C9–N1 bond connecting the –NEt₂ moiety to the thiazete ring is considerably shorter (phase B: 1.307 (3) Å; phase A: 1.318 (3) Å) than the adjacent, formally double, endocyclic C9=N2 bond (phase B: 1.331 (3) Å; phase A: 1.327 (3) Å). A possible explanation resides in the existence of an extended π conjugated system between the electron-donor diethylamine fragment and the electron-withdrawing sulfonyl group. This conjecture is supported by the values of the C–N1–C angles, which in both phases range from $\sim 118^\circ$ to $\sim 122^\circ$ and are compatible with a formally sp^2 tertiary nitrogen atom. Very similar bond distances within the thiazete group have been reported by Clerici *et al.* (1996) for a chemically related derivative of (I). On geometrical grounds, no relevant intermolecular hydrogen bonds have been found in both phases.

S2. Experimental

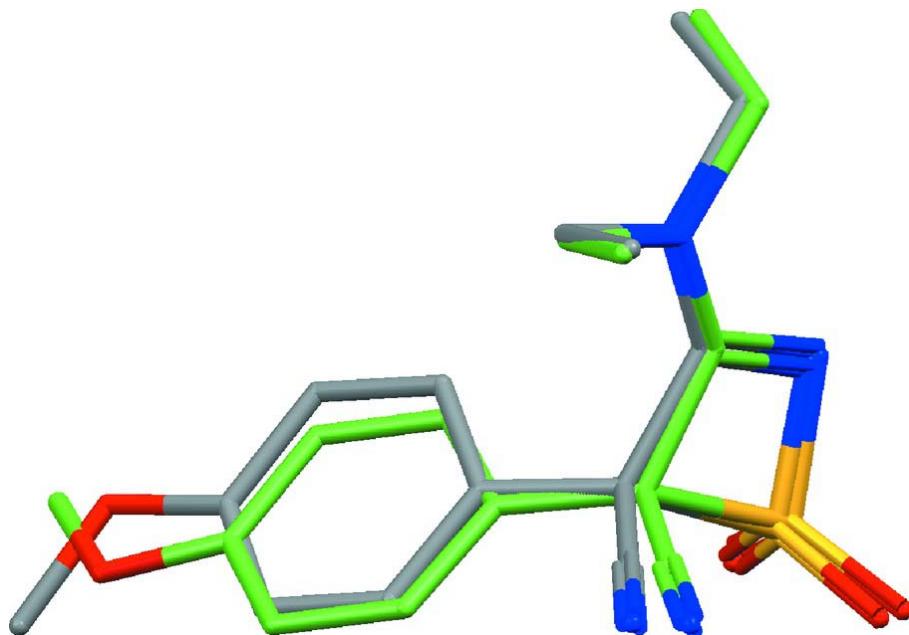

The compound (I) was synthesized using the procedure reported by Clerici *et al.* (2002). Part of the material obtained from dichloromethane and diethyl ether (phase A) was dissolved in distilled water and crystallized by slow solvent evaporation at room temperature. After roughly 7 days, very small colorless crystals with the same habit (prism) as the most common phase A appeared. Only the X-ray analysis revealed that in fact a new polymorph (phase B) was obtained.

S3. Refinement

All hydrogen atoms have been located by difference Fourier. Data collection: SMART (Bruker, 2005); cell refinement: SAINT (Bruker, 2005); data reduction: SAINT (Bruker, 2005); absorption correction: SADABS (Bruker, 2007); program used to solve structure: SHELXS97 (Sheldrick, 2008); program used to refine structure: SHELXL97 (Sheldrick, 2008); molecular graphic: DIAMOND (Brandenburg, 2010); overlay scheme: Mercury CSD 2.3

**Figure 1**

Molecular structure of (I), with the non-H atom numbering scheme. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

Least-squares overlay scheme of the asymmetric units of (I) within phase B (this work, carbon backbone in gray) and phase A (Clerici *et al.*, 2002; carbon backbone in green). Hydrogen atoms omitted for clarity.

Secondary atom site location: structure-
invariant direct methods
Hydrogen site location: difference Fourier map
All H-atom parameters refined
 $w = 1/[\sigma^2(F_o^2) + (0.0446P)^2 + 0.4078P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.16$ e Å⁻³
 $\Delta\rho_{\min} = -0.31$ e Å⁻³

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
