Received 31 July 2010; accepted 16 August 2010

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.038;  $wR$  factor = 0.099; data-to-parameter ratio = 11.9.

In the title compound,  $[\text{RuCl}(\text{C}_{10}\text{H}_{14})(\text{C}_{14}\text{H}_{16}\text{N}_2)]\text{PF}_6$ , the aromatic ring of the isopropylmethylbenzene fragment shows an  $\eta^6$ -arene coordination to the ruthenium atom. Its coordination sphere is completed by a chloride ligand and 2-(*sec*-butyliminomethyl)quinoline. The dihedral angle between the  $\eta^6$ -arene ring and the quinoline Schiff base is  $45.64(9)^\circ$ . The *sec*-butyl substituent and the  $\text{PF}_6^-$  anion are disordered over two positions with ratios of 0.595 (11):0.405 (11) and 0.752 (8):0.248 (8), respectively.

## [2-(sec-Butyliminomethyl)quinoline]chlorido( $\eta^6$ -1-isopropyl-4-methylbenzene)-ruthenium(II) hexafluoridophosphate

José Luis Gárate-Morales, Simón Hernández-Ortega and Juan Manuel Fernández-G

### S1. Comment

Schiff bases are found among the most convenient and attractive ligands for ruthenium complexes (Bennet *et al.* 1982), by steric and electronic effects around the Ru core, the donor atoms, N and O, of the chelated Schiff bases exert two opposite electronic effects (Brunner *et al.*, 2003; Lalrempuia *et al.* 2003; Moreno *et al.* 2009]. As result of their particular structure, these ruthenium complexes display an enhanced activity and selectivity in a multitude of organic transformations [Drozdak *et al.* 2005 & Opstal *et al.* 2003]. Due to importance of Schiff base ruthenium-arene complexes show as catalysts, we describe the synthesis and structural analysis of a new ruthenium Schiff base complex using an iminomethylquinoline as ligand.

The molecular structure of (I) with the numbering scheme is shown in Fig. 1. Selected bond distances, bond angles and torsion angles are shown in table 1. The structure exhibits an  $\eta^6$  - arene coordination of the isopropylmethylbenzene bonded to the ruthenium mononuclear structure, completing the coordinations sphere a chloride atom and 2-N-sec-butyl-iminomethylquinoline Schiff base are found. While the structure of classical Schiff bases have a fragment (O—C=C—C=N) and form a six member chelate ring with the metal atom as sixth member of the chelate, in (I) the Schiff base fragment (N1—C11—C20—N2) is forming a five member chelate ring with the ruthenium atom as fifth member of the chelate. The  $\eta^6$  - arene coordination and Schiff base fragment are not coplanar and are forming a dihedral angle of 52.94°(9)°. The quinoline ring is slightly deviated of planarity [0.044 (3) Å], while N1—C11—C20—N2 is planar [0.040 (2) Å]

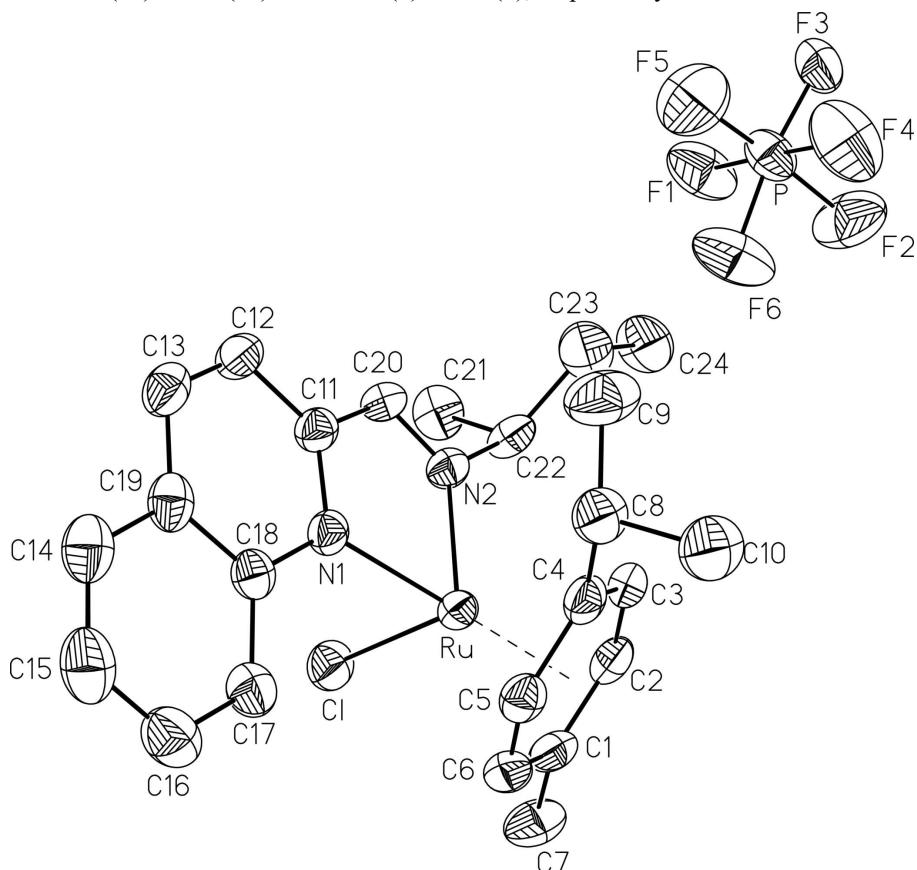

### S2. Experimental

Schiff base ligand. To a solution of 2-quinolinicarboxaldehyde (1.0 g) in 150 ml of ethanol was added 0.64 ml (0.47 g) of sec-butylamine. The mixture was heated at 60 °C for 5 h, then concentrated until all the solvent was distilled. The residual deep yellow oil was then vacuum distilled obtaining 1.32 g of a light yellow liquid which was characterized by <sup>1</sup>H NMR and IR spectroscopy.

Ruthenium derivative. To a solution of 0.9 g of di-*m*-Cl-bis([Cl( $\eta^6$ -1-isopropyl-4-methylbenzene)Ru(II)] in 40 ml of anhydrous methanol under nitrogen was added 0.0636 g of the 2-[*N*-(sec-butyliminomethyl)]quinoline followed of 0.110 g of potassium hexafluorophosphate the reaction mixture was stirred for 3 h. The color of the reaction mixture changed from initially orange to deep red at the end and by solvent concentration a precipitate was formed which was separated and dissolved in dichloromethane. The obtained solution was filtered through celite, concentrated and stored in a freezer at -30 °C for 48 h obtaining 0.75 g of a product as red crystals. This product (I) was characterized by IR spectroscopy and mass spectrometry (FAB+). Good quality crystals suitable for the X-ray diffraction study, were obtained by slow layer diffusion of methanol into a saturated dichloromethane solution of compound (I) at room temperature.

**S3. Refinement**

H atoms were placed in geometrically idealized positions [0.98 Å (for CH), 0.97 Å (for CH<sub>2</sub>), 0.96 Å (for CH<sub>3</sub>) and 0.93 Å (for CH aromatic)] and refined using the riding model with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  or 1.5  $U_{\text{eq}}\text{C}(\text{methyl})$ . The *sec*-butyl substituent and hexafluorophosphate anion are disordered and were refined anisotropically in two positions with site occupation factors of 0.595 (11)/0.405 (11) and 0.752 (8)/0.248 (8), respectively.

**Figure 1**

The molecular structure with numbering scheme. Displacement ellipsoids are drawn at the 40% probability level. The H atom bonded to C atom and disordered atoms were omitted for clarity.

 $\Delta\rho_{\min} = -0.40 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^{2\wedge}$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^{2\wedge}$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^{2\wedge}$ . The threshold expression of  $F^{2\wedge} > \sigma(F^{2\wedge})$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^{2\wedge}$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
