

Bis[(2-aminophenyl)methanol- κ^2O,N]-bis(nitrate- κO)manganese(II)

Majid Esmhosseini* and Shahrzad Maleki

Department of Chemistry, University of Urmieh, Urmieh, Iran
Correspondence e-mail: m.esmhosseini@urmia.ac.ir

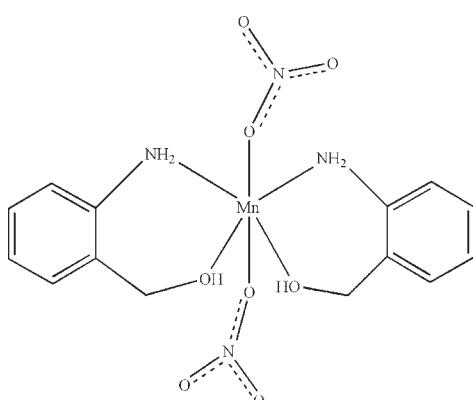

Received 17 July 2010; accepted 28 July 2010

Key indicators: single-crystal X-ray study; $T = 120\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$;
 R factor = 0.038; wR factor = 0.071; data-to-parameter ratio = 17.3.

In the title compound, $[\text{Mn}(\text{NO}_3)_2(\text{C}_7\text{H}_9\text{NO})_2]$, the Mn^{II} atom (site symmetry 2) is coordinated by two N,O -bidentate (2-aminophenyl)methanol ligands and two monodentate nitrate anions in a distorted *cis*- MnN_2O_4 octahedral coordination geometry. In the crystal, $\text{N}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds help to establish the packing.

Bis[(2-aminophenyl)methanol- κ^2O,N]bis(nitrato- κO)manganese(II)

Majid Esmhosseini and Shahrzad Maleki

S1. Comment

(2-Aminophenyl)methanol is a bidentate ligand ligand. There are only two complexes with this ligand that have been prepared: those of Re (Bandoli *et al.*, 2002) and Al (Lewiriski *et al.* 1998). We report herein the synthesis and crystal structure of the title compound, (I).

The asymmetric unit of the title compound, Fig. 1, contains half molecule. The Mn^{II} atom is six-coordinated in distorted hexagonal configurations by two N and two O atoms from two (2-aminophenyl)methanol ligand and two O atoms from two nitrate anions. The Mn—O and Mn—N bond lengths and angles are collected in Table 1.

Intermolecular N—H···O, O—H···O and C—H···O hydrogen bonding may stabilize the structure, (Table 2, Fig. 2).

S2. Experimental

A solution of (2-aminophenyl)methanol (0.25 g, 2.00 mmol) in methanol (10 ml) was added to a solution of Mn(NO₃)₂·4H₂O (0.25 g, 1.00 mmol) in methanol (10 ml) and the resulting colorless solution was stirred for 20 min at 313 K. This solution was left to evaporate slowly at room temperature. After one week, colorless needles of (I) were isolated (yield 0.33 g, 77.6%).

S3. Refinement

The N- and O-bound H atoms were located in a difference map and freely refined. All C-bound H atoms were positioned geometrically, with C—H = 0.93 Å and constrained to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

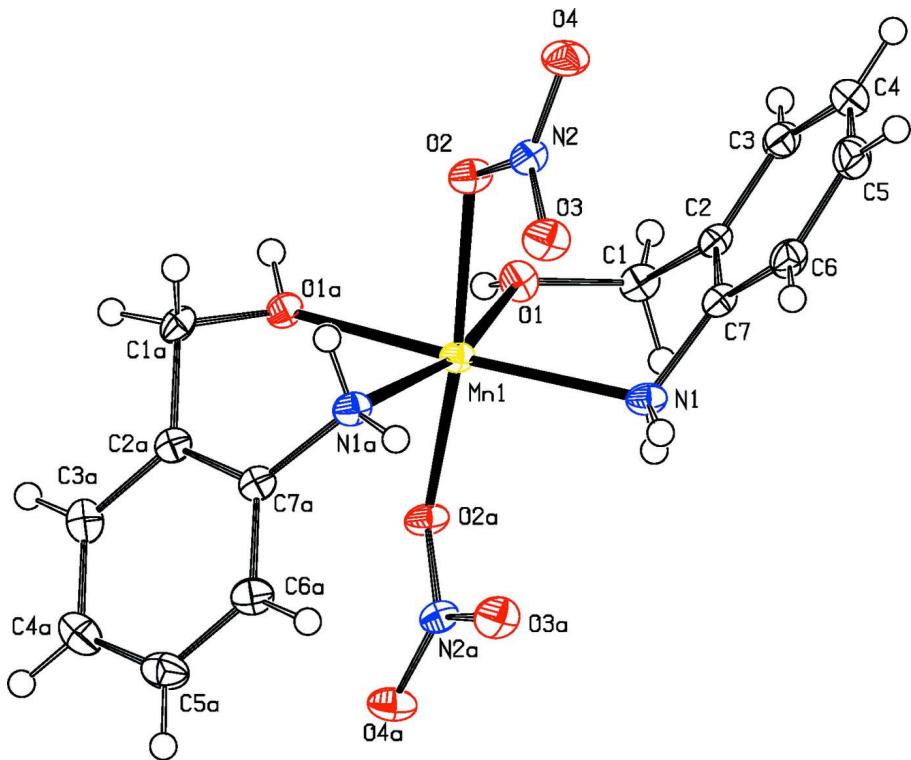

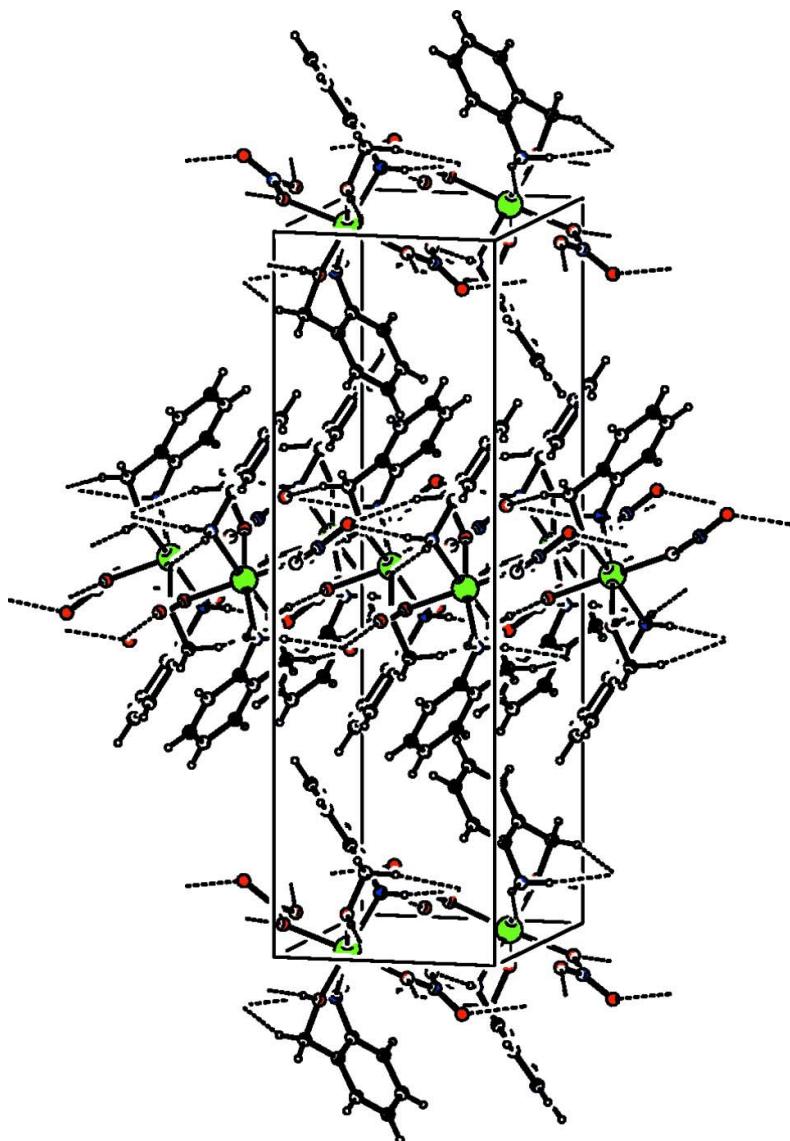

Figure 1

The molecular structure of (I) with displacement ellipsoids drawn at the 50% probability level. Atoms with suffix a are generated by $(1-x, y, 1/2-z)$.

**Figure 2**

Unit-cell packing diagram for (I). Hydrogen bonds are shown as dashed lines.

 $w = 1/[\sigma^2(F_o^2) + (0.017P)^2 + 1.3224P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} = 0.007$
 $\Delta\rho_{\max} = 0.31 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.32 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
