Received 27 July 2010; accepted 3 August 2010

Key indicators: single-crystal X-ray study;  $T = 125$  K; mean  $\sigma(C-C) = 0.004$  Å; disorder in main residue;  $R$  factor = 0.027;  $wR$  factor = 0.059; data-to-parameter ratio = 18.9.

The title compound,  $[Au(C_{18}H_{27}ClN_3)(C_{18}H_{15}P)](NO_3)_2$ , is a coordination complex of gold(I) triphenylphosphine with the N atom in the quinoline ring of the common antimalarial compound chloroquine (CQ). The pendant diethylamino group of the CQ ligand was found to be protonated. The complex exhibits a nearly linear coordination geometry around the  $Au^I$  atom [ $N-Au-P = 176.94$  (6)°], with  $Au-N$  and  $Au-P$  bond lengths of 2.070 (2) and 2.2338 (7) Å, respectively. The diethylammonium group and one of the two nitrate counter-ions are disordered with occupancy ratios of 0.519 (4):0.481 (4). The nitrate anions are hydrogen bound to both the amino and ammonium groups of the *N,N*-diethylpentanaminium fragment of the CQ.

## {4-[(7-Chloro-4-quinolyl)amino]-N,N-diethylpentanaminium}(triphenylphosphine)gold(I) dinitrate

Marina Hitosugi-Levesque and Joseph M. Tanski

### S1. Comment

Chloroquine (CQ) has been used in treatments against the malaria parasites *Plasmodium falciparum* and *Plasmodium vivax*. Wide use of CQ has led to cross-resistance, limiting the efficacy of CQ related treatments. (World Health Organization, 2010). Complexing CQ with metal containing fragments such as gold(I) triphenylphosphine and gold (III) tetrachloride can enhance its ability to combat CQ-resistant strains of malaria (Navarro *et al.* 1997; Navarro *et al.* 2004), as can CQ complexes of Rh and Ru (Sánchez-Delgado *et al.* 1996). While some of the biological effects of coordinating metals to chloroquine and its derivatives have been reported, a lack of structure-activity correlation remains.

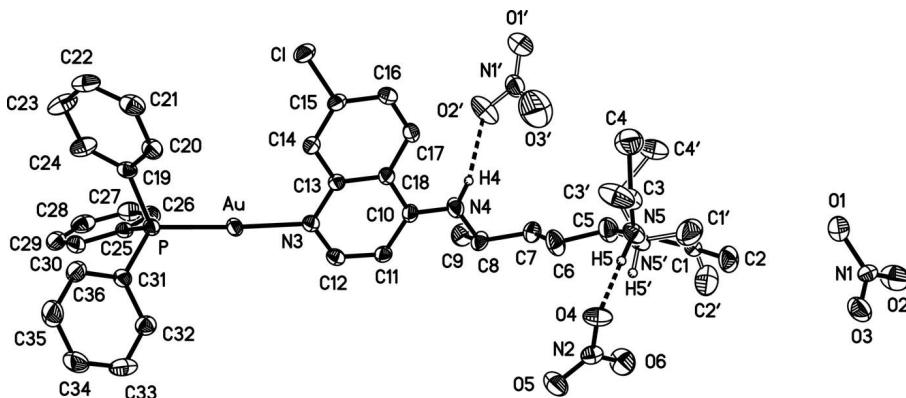

In the title complex (Fig. 1) gold(I) is coordinated to the nitrogen atom in the quinoline ring as proposed earlier (Navarro *et al.* 1997). The complex exhibits a nearly linear coordination geometry around gold, with an N—Au—P angle of 176.94 (6)°. The Au—N and Au—P bond distance are 2.070 (2) Å and 2.2338 (7) Å, respectively. These bond distances are similar to those found in the structure of (triphenylphosphine)gold(I) chloride, with Au—P 2.2313 (4) Å (Borissova *et al.*, 2008), as well as the Au—N and Au—P distances in the structure of the cationic pyridine adduct (triphenylphosphine)gold(I) pyridine tetrafluoroborate, with Au—N 2.073 (3) Å and Au—P 2.2364 (8) Å (Thwaite *et al.*, 2004). The pendant diethylamino group (N4) of the CQ ligand in the title complex was found to be protonated, and the nitrate anions are hydrogen bound to both the N1 amino and N4 ammonium groups of the 1,4-pentanediamine fragment of the CQ.

### S2. Experimental

$[(\text{CQ})\text{Au}(\text{PPh}_3)][\text{NO}_3]$  was prepared from chloroquine (CQ) free base and triphenylphosphine ( $\text{PPh}_3$ ) according to literature procedure (Navarro *et al.*, 2004). The protonated title complex,  $[\text{C}_{36}\text{H}_{42}\text{AuClPN}_3](\text{NO}_3)_2$  was obtained by diffusion of diethyl ether into an acetone solution of  $[(\text{CQ})\text{Au}(\text{PPh}_3)][\text{NO}_3]$  over a period of two weeks. All manipulations were carried out under nitrogen using common Schlenk technique. X-ray diffraction quality crystals were separated as colorless plates.

### S3. Refinement

Hydrogen atoms on carbon were included in calculated positions and were refined using a riding model at C—H = 0.95, 0.98 and 0.99 Å and  $U_{\text{iso}}(\text{H}) = 1.2, 1.5$  and  $1.2 \times U_{\text{eq}}(\text{C})$  of the aryl, methyl and methylene C-atoms, respectively. The hydrogen atom on N4 was refined semi-freely with the help of a distance restraint at N—H = 0.88 Å and  $U_{\text{iso}}(\text{H}) = 1.2 \times U_{\text{eq}}(\text{N})$ . The presence of a residual electron density peak and the proximity of a nitrate anion indicated that N5 was protonated. Hydrogen atoms on N5 were included in calculated positions and were refined using a riding model at N—H = 0.93 Å and  $U_{\text{iso}}(\text{H}) = 1.2 \times U_{\text{eq}}(\text{N})$ .

**Figure 1**

A view of the title complex, with displacement ellipsoids shown at the 50% probability level. H atoms on carbon have been omitted for clarity; primed atoms represent the disordered fraction of the NO<sub>3</sub> ion and the diethylammonium group.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
