Received 21 July 2010; accepted 8 September 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.047; wR factor = 0.110; data-to-parameter ratio = 12.9.

The title compound, $\{[\text{Cd}(\text{C}_{19}\text{H}_{13}\text{N}_4\text{O}_4)_2(\text{H}_2\text{O})_2]\cdot 4\text{H}_2\text{O}\}_n$, or $\{[\text{Cd}(\text{BBA})_2(\text{H}_2\text{O})_2]\cdot 4\text{H}_2\text{O}\}_n$, where BBA is 3,5-bis(isonicotinamido)benzoate, is isotopic with its Mn isologue [Chen *et al.* (2009). *J. Coord. Chem.* **62**, 2421–2428]. The cation sits on a twofold axis and is six-coordinated in a slightly distorted octahedral geometry; the polyhedra are linked into zigzag chains, which are further connected by $\text{N}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{N}$ hydrogen bonds as well as $\pi-\pi$ interactions [centroid-centroid distance of $3.639(2)\text{ \AA}$], giving a three-dimensional supramolecular framework.

Man-Sheng Chen, Yi-Fang Deng, Chun-Hua Zhang and Dai-Zhi Kuang

S1. Comment

Coordination polymeric structures are one of the most attractive areas of materials research due to their intriguing structural topologies and functional properties such as molecular adsorption, magnetism and luminescence (Evans & Lin, 2002; Yaghi *et al.*, 2003; Kitagawa *et al.*, 2004; Biradha *et al.*, 2006; Wu *et al.*, 2009) but in spite of this interest the rational design and synthesis of new supramolecular frameworks by covalent and weak intra/intermolecular interactions is still a challenge (Eddaoudi, *et al.* 2001; Moulton & Zaworotko, 2001; Cheng, *et al.* 2002; Zhang, *et al.* 2003; Go, *et al.* 2004). On the other hand, it is well known that carboxylate and pyridine groups have good coordination capacities as well as the amide group, a fascinating functional group with two different types of hydrogen bonding sites: the –NH moiety which acts as an electron acceptor while the –C=O group acts as an electron donor (Lee, *et al.*, 1962; Bent, 1968; Huyskens, 1977; Wang, *et al.*, 2007). we have recently pursued systematic investigations into the assembly of polymers through ligands containing both carboxylate and amido-pyridine groups, in order to study the influence of different metal ions. In the present work we report the structure of a new cadmium coordination polymer of the bridging ligand 3,5-bis(isonicotinamido)benzoate (BBA^-), namely $\{[\text{Cd}(\text{BBA})_2(\text{H}_2\text{O})_2]\cdot 4(\text{H}_2\text{O})\}_n$, (I), which is isomorphous to its Mn isologue $[\text{Mn}(\text{BBA})_2(\text{H}_2\text{O})_2]$ (Chen, *et al.* 2009).

As shown in Fig. 1, the asymmetric unit of (I) is composed of one-half of a Cd^{II} cation, which sits on a crystallographic twofold axis, one BBA^- ligand, one coordinated water molecule and two solvent water molecules. The central Cd^{II} atom has the $[\text{CdN}_2\text{O}_4]$ octahedral coordination geometry with four coordination sites in one plane occupied by two *cis*-positioned N atoms from two BBA^- ligands ligands and two water molecules, and the other two coordination sites taken up by two *trans*-positioned carboxylate O atoms from two further BBA^- ligands. The ligand (3,5-bis(isonicotinamido)-benzoic acid) is fully deprotonated(BBA^-) and the carboxylate group adopts a monodentate mode, coordinating only through one O atom to one Cd^{II} centre. On the other hand, the dihedral angles between the central benzene and terminal pyridine ring are 15.66 (10)° and 19.72 (11)°, respectively.

It is noteworthy that each BBA^- ligand in turn uses its carboxylate group and one of the two pyridinyl groups to connect two metal centers, while the other pyridinyl group does not coordinate. Then, two Cd(II) and two BBA^- ligands form a $\text{Cd}_2(\text{BBA})_2$ macrocyclic ring with Cd–Cd distance of 12.313 (18) Å. Such $M_2(\text{BBA})_2$ macrocyclic rings are further connected by Cd—N and Cd—O coordination bonds to give an infinite one-dimensional zigzag chain structure(Fig. 2).

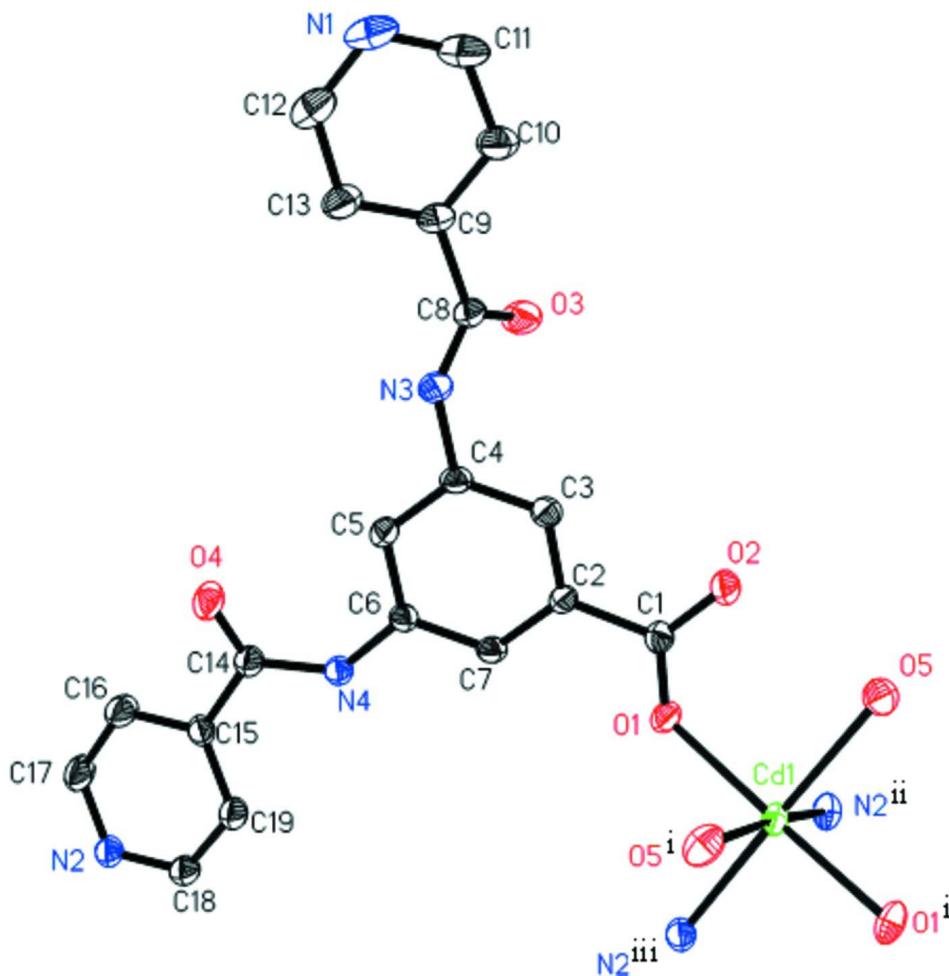

In addition, there are non-bonding interactions which consolidate the framework structure, in particular some O—H···O, N—H···O and O—H···N hydrogen bonds (Table 1) as well as π – π interactions between the central benzene ring of BBA^- anions (C2-->C7) and its symmetry related counterpart, symmetry code:1/2 - x ,3/2 - y ,- z) with a centroid-centroid distance of 3.639 (2) Å, and slippage and interplanar distances of 1.514 and 3.308 Å, respectively.

S2. Experimental

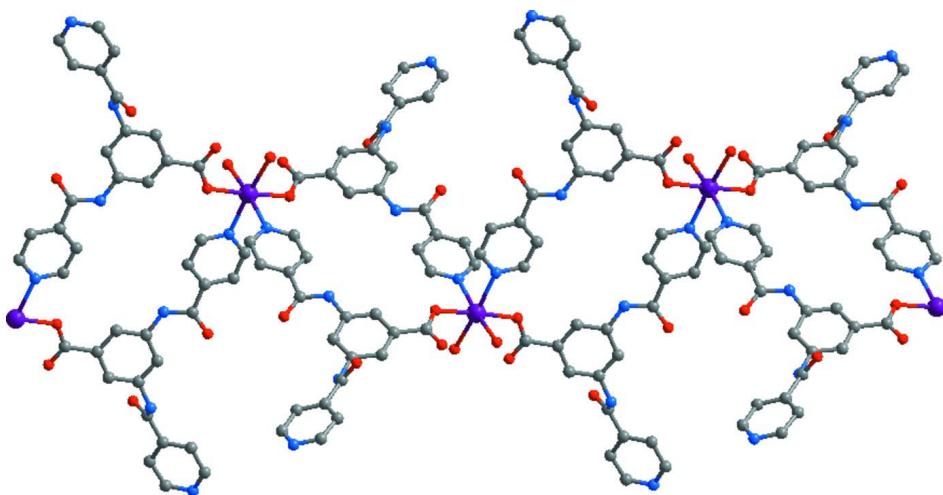

All reagents and solvents were used as obtained commercially without further purification. A mixture containing Cd(NO₃)₂.6H₂O (31.1 mg, 0.1 mmol), HL (36.5 mg, 0.12 mmol), N(CH₂CH₃)₃ (0.5 mL, 0.1 mmol), 10 ml H₂O was sealed in a 16 ml Teflon-lined stainless steel container and heated at 393 K for 3 days. After cooling to room temperature within 12 h, block colorless crystals of (I) suitable for X-ray diffraction analysis were obtained in 39% Yield. Anal. Calcd for C₃₈H₃₈CdN₈O₁₄: C, 48.39; H, 4.06; N, 11.88%; Found: C, 48.43; H, 4.11; N, 11.76%.

S3. Refinement

H atoms bonded to C atoms were placed geometrically and treated as riding, with C—H distances 0.93 Å and U_{iso}(H) = 1.2U_{eq}(C). The H atoms of water molecules were determined from a difference Fourier synthesis and refined with restrained O—H distances 0.85 (2) Å. The amide H atoms were located from difference maps and refined with the N—H distances restrained to 0.8600 Å.

**Figure 1**

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
