Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.047;  $wR$  factor = 0.130; data-to-parameter ratio = 14.2.

The title compound,  $\text{C}_{17}\text{H}_{24}\text{O}_2$ , is the product of a haloform reaction of 6-acetyl-1,1,2,4,4,7-hexamethyltetraline (AHTN). The compound is a racemic mixture with a disorder in its aliphatic ring [occupancy ratio 0.683 (4):0.317 (4)] due to two possible half-chair forms. The carboxylic acid unit is slightly twisted out of coplanarity with the aromatic system [dihedral angle = 29.26 (6) $^\circ$ ]. In the crystal, pairs of short classical intermolecular O—H $\cdots$ O hydrogen bonds link pairs of molecules around a center of symmetry.

## 3,5,5,6,8,8-Hexamethyl-5,6,7,8-tetrahydro-2-naphthoic acid (AHTN-COOH)

Paul Kuhlich, Robert Göstl, Ramona Metzinger, Christian Piechotta and Irene Nehls

### S1. Comment

The title compound is the carboxylic acid AHTN-COOH **2** of 6-acetyl-1,1,2,4,4,7-hexamethyltetraline (AHTN) obtained by a Haloform reaction (Fuson & Bull, 1934) of AHTN **1** with sodium hypochlorite solution (NaOCl). The reaction mechanism is shown in Figure 1. A similar synthesis was given by Valdersnes *et al.* (2006). AHTN-COOH **2** might be a disinfection by-product of AHTN **1**.

AHTN itself is a widely used fragrance in cosmetics and cleaning products. Its commonest trade name is Tonalide. The crystal structure of AHTN was shown by De Ridder (De Ridder *et al.*, 1990). AHTN is produced in the ton-scale, in 2000, approx. 343,000 kg (Kupper *et al.*, 2004) and introduced into the environment mainly by sewage treatment plants supplied by municipal wastewater. It can be found in surface water at low  $\mu\text{g/L}$  concentration (Heberer, 2003). Due to the low estrogenic potential of AHTN (Bitsch *et al.*, 2002) this might induce a health concern.

The industrial synthesis of AHTN **1** is shown in Figure 2. Both starting chemicals are inexpensive and readily available: *para*-cymene and *neo*-hexene, the later results from an olefin metathesis of di-*iso*-butylene with ethylene (Sell, 2006). AHTN **1** is obtained as racemic mixture in industrial-scale. Hence, the title compound AHTN-COOH **2** is obtained as racemic mixture, too.

The compound (Fig. 3) is crystallizing in the monoclinic space group P21/c. It shows disorder (68:32) within the cyclohexane moiety: the two possible half-chair forms are present.

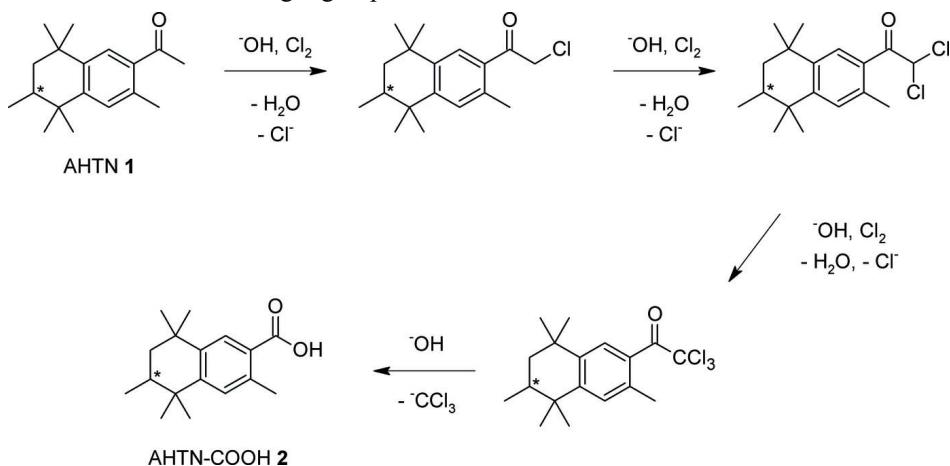

The compound exhibits a short classical intermolecular H bond which links the molecules into pairs around a center of symmetry (Fig. 4). A summary of these interactions is compiled in Table 1.

### S2. Experimental

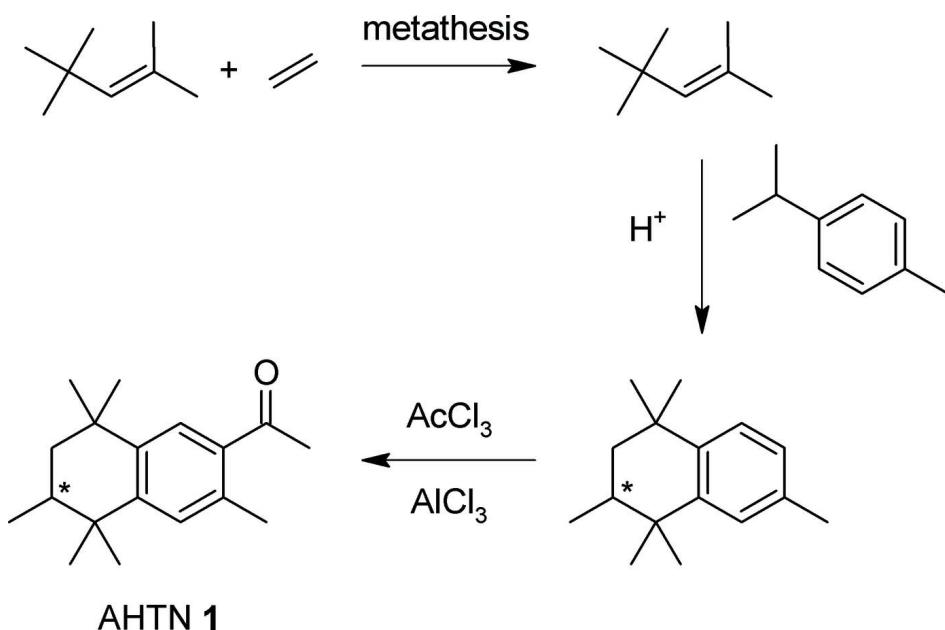

NaOCl was added to a solution of racemic AHTN in acetonitrile. The mixture was stirred for 72 h at room temperature. Afterwards water was added to dissolve precipitated salt, sodium sulfite to quench free chlorine and 6 M hydrochloric acid to adjust the pH to one. The organic layer was extracted with diethyl ether. The extracts were combined, dried over anhydrous sodium sulfate and filtered. Evaporation of the solvent *in vacuo* gave a white crystalline residue that was washed with cyclohexane. Recrystallization from diethyl ether resulted in colorless crystals [m.p. 497 K]. IR ( $\nu$ ,  $\text{cm}^{-1}$ ): 1675(s), 1609(s), 1550(s), 1498(s), 1364(s), 1305(s), 1262(s), 1247(s), 1111(s), 912(s), 885(s), 850(s);  $^1\text{H-NMR}$  (500 MHz; CD<sub>3</sub>OD; TMS):  $\delta$  [ppm] = 7.88 (1H, s), 7.24 (1H, s), 2.52 (3H, s), 1.89 (1H, m), 1.64 (1H, dd,  $^2\text{J}=13.3\text{Hz}$ ,  $^3\text{J}=13.3\text{Hz}$ ), 1.41 (1H, dd,  $^2\text{J}=13.5\text{Hz}$ ,  $^3\text{J}=2.6\text{Hz}$ ), 1.33 (3H, s), 1.30 (3H, s), 1.25 (3H, s), 1.07 (3H, s), 1.01 (3H, d,  $J=6.9\text{Hz}$ );  $^{13}\text{C-NMR}$  (125 MHz, CD<sub>3</sub>OD, TMS):  $\delta$  [ppm] = 171.5, 151.6, 143.4, 137.8, 131.3, 130.5, 128.5, 44.7, 38.9, 35.8, 35.0, 32.8, 32.4, 28.9, 25.1, 21.9, 17.3; (+)-ESI/MS: 261.5 (40) [ $M+\text{H}^+$ ], 283.5 (100) [ $M+\text{Na}^+$ ].

**S3. Refinement**

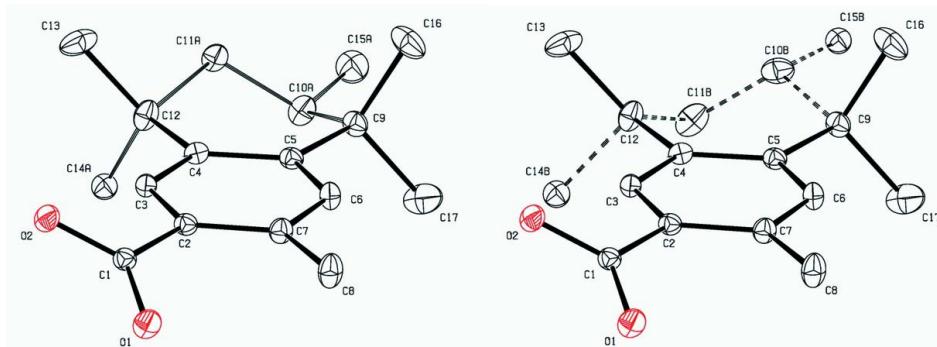

Non-H atoms were refined anisotropically and all H atoms were placed in calculated positions and refined using a riding model with C—H distances of 0.93 Å for the CH groups, 0.97 Å for the CH<sub>2</sub> groups and 0.96 Å for the CH<sub>3</sub> groups,  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{non-H})$ , except for the H<sub>2</sub> atom which was found in the electron density map and fixed in its position. Methyl groups were allowed to rotate as rigid groups.

**Figure 1**

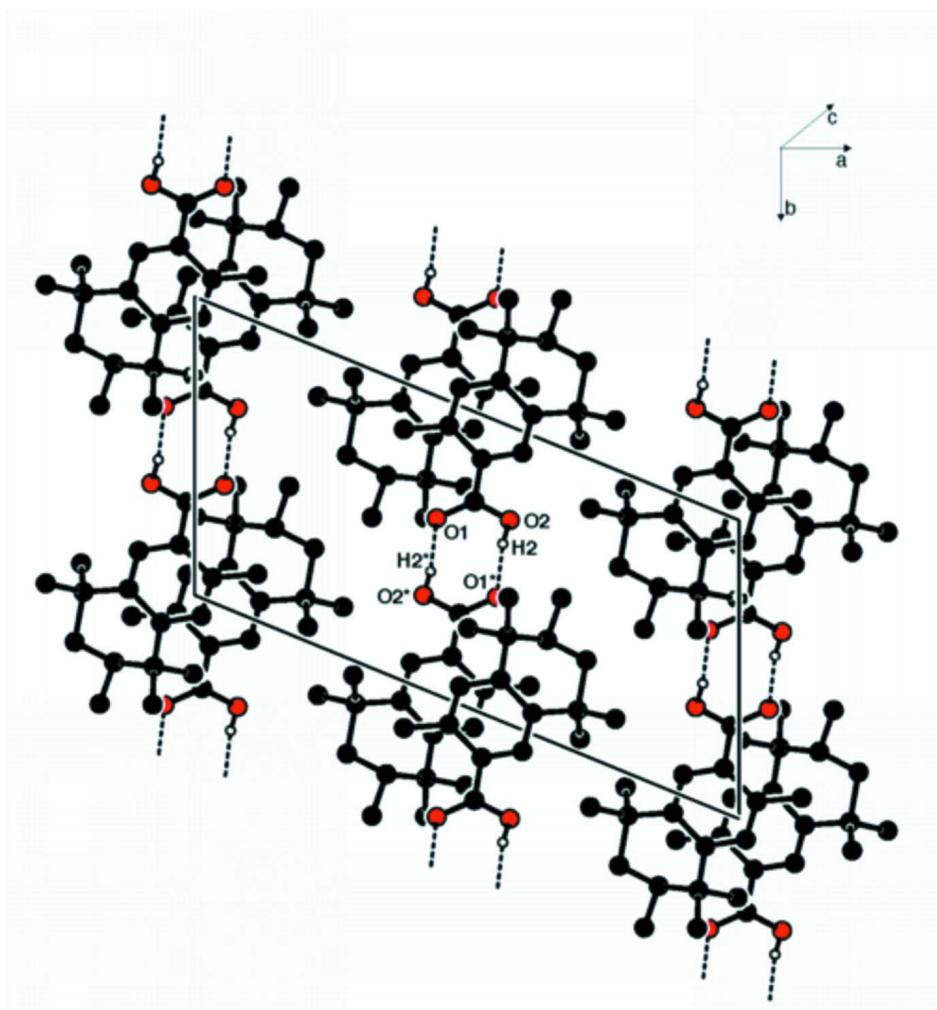

Haloform reaction of AHTN 1 to result in AHTN-COOH 2.

**Figure 2**

Industrial production of AHTN 1.

**Figure 3**

Displacement parameter plots of the two half-chair conformations in the crystal structure. Displacement ellipsoids are set to 30% probability, H atoms were excluded for clarity.

**Figure 4**

Packing diagram of the unit-cell content, view direction [0 1 0]. All H atoms are excluded except for the one involved in H bond formation. Only one conformer is shown.

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
