Key indicators: single-crystal X-ray study; $T = 98$ K; mean $\sigma(\text{C-C}) = 0.005$ Å; R factor = 0.031; wR factor = 0.091; data-to-parameter ratio = 14.5.

In the title salt, $[\text{Ag}_2(\text{CF}_3\text{CO}_2)_2(\text{C}_{10}\text{H}_8\text{N}_2)]_n$, which may also be regarded as a coordination polymer if long $\text{Ag}\cdots\text{O}$ interactions are considered, each of the N atoms of the somewhat twisted 2,2'-bipyridine molecule [$\text{N}-\text{C}-\text{C}-\text{N} = -27.5$ (4) $^\circ$] binds to an Ag atom, and each of the carboxylate ligands is tridentate, linking to three Ag atoms. The bidentate carboxylate O atoms bridge the same two Ag atoms, resulting in the formation of Ag_2O_2 rings. These rings are bridged by the 2,2'-bipyridine ligands, forming a chain along the b axis. The chains are linked into double chains *via* the remaining Ag–O bonds and Ag–Ag contacts. As a consequence of the Ag–Ag contacts, the NO_4^- donor set about each Ag atom is heavily distorted. Finally, the chains are linked into a three-dimensional network by a combination of C–H \cdots O and C–H \cdots F interactions.

S1. Comment

Supramolecular structures of silver salts are highly dependent upon the nature of counter anions and the presence of solvent (Kundu *et al.*, 2010). During the course of on-going crystal engineering studies on silver salts (Arman *et al.*, 2010), the title salt was isolated and characterized.

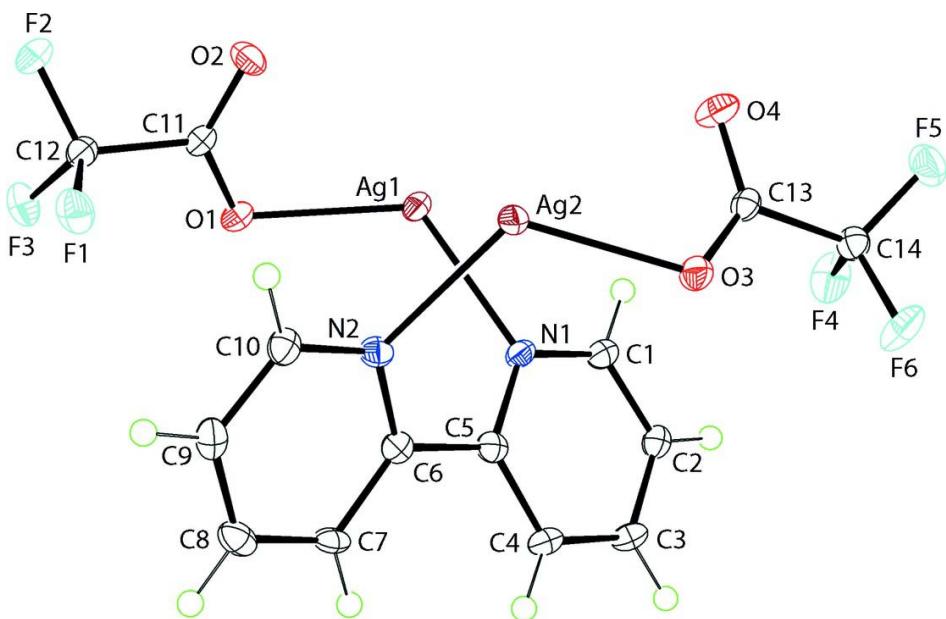

The asymmetric unit of (I) comprises two Ag cations, a 2,2'-bipyridine molecule and two trifluoroacetate anions, Fig. 1. Each of the 2,2'-bipyridine-N atoms coordinates to a Ag atom bringing into close proximity the Ag1 and Ag2 atoms [Ag1…Ag2 = 3.1941 (7) Å]. In order to relieve steric pressure, the 2,2'-bipyridine molecule is twisted as seen in the torsion angle [N1–C5–C6–N2 = -27.5 (4) °] and the dihedral angle formed between the pyridine rings of 26.93 (15) °. Each Ag atom forms a close Ag–O bond to a carboxylate-O, *i.e.* Ag1–O1 and Ag2–O3, Table 1, and each of the O1 and O3 atoms also bridges a neighbouring Ag atom to form a non-planar Ag₂O₂ ring. The second carboxylate-O atom in each case, *i.e.* O2 and O4, bridges to a different Ag atom so that each carboxylate ligand is tridentate. The supramolecular assembly is a double chain along the *b* axis whereby one row of Ag₂O₂ rings bridged by 2,2'-bipyridine molecules is connected to a second row *via* the Ag1–O2 and Ag2–O4 bonds and *vice versa*. Additional stability to the double chain is afforded by Ag1…Ag1 and Ag2…Ag2 interactions, Fig. 2 and Table 1. In terms of coordination geometry, each Ag atom exists within a NO₃ donor set which is grossly distorted owing to the presence of two close Ag…Ag contacts. Chains are consolidated in the crystal packing by a combination of C–H…O and C–H…F contacts, Table 2.

S2. Experimental

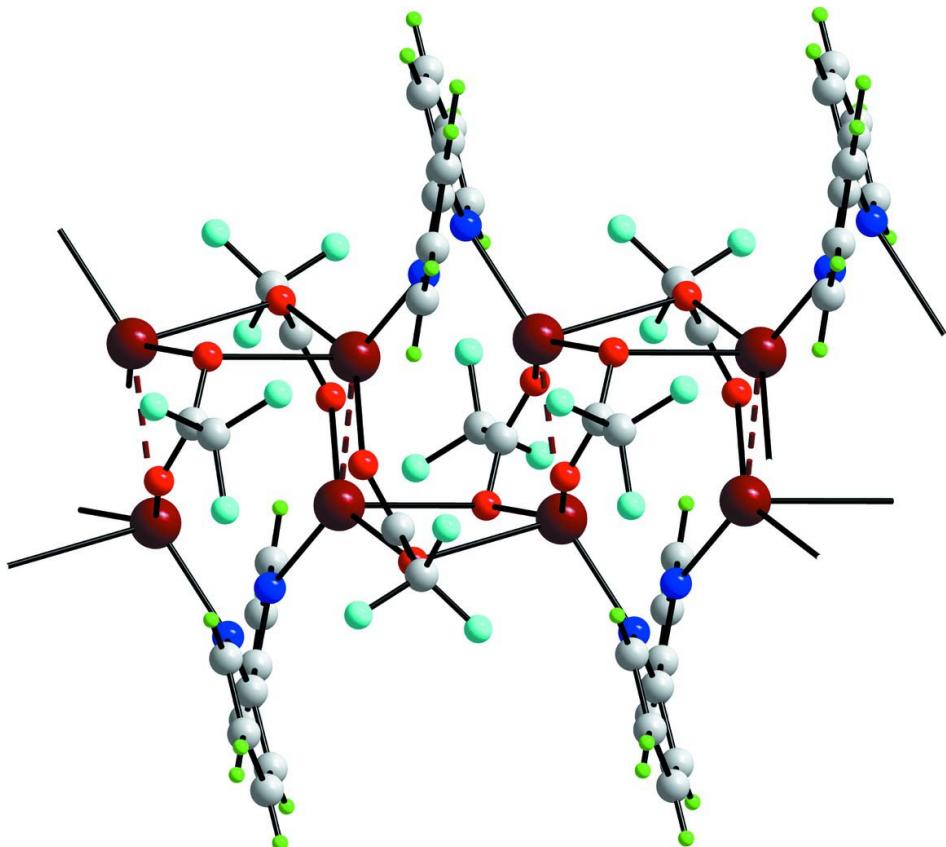

2,2'-Bipyridine (0.015 g, 0.1 mmol) was dissolved in 5 ml of methanol. Added to this was silver trifluoroacetate (0.044 g, 0.2 mmol) dissolved in 7 ml of methanol. The resulting solution was gently heated and allowed to stand for slow evaporation affording colourless blocks of (I) after five days.

S3. Refinement

C-bound H-atoms were placed in calculated positions (C–H 0.95 Å) and were included in the refinement in the riding model approximation with $U_{\text{iso}}(\text{H})$ set to 1.2 $U_{\text{eq}}(\text{C})$. In the final refinement a low angle reflection evidently effected by the beam stop were omitted, *i.e.* (200).

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
