Received 18 November 2010; accepted 26 November 2010

Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.045;  $wR$  factor = 0.115; data-to-parameter ratio = 16.7.

In the title centrosymmetric tetrานuclear complex,  $[\text{Mn}_4(\text{C}_{12}\text{H}_6\text{O}_4)_4(\text{C}_{10}\text{H}_8\text{N}_2)_4(\text{H}_2\text{O})_8] \cdot 4\text{H}_2\text{O}$ , two independent Mn<sup>II</sup> ions are coordinated in a slightly distorted octahedral environment by two aqua ligands, two naphthalene-1,8-dicarboxylate (1,8-nap) ligands and one bis-chelating 2,2'-bipyridine (2,2'-bipy) ligand. In the crystal, molecules are linked by intermolecular O—H···O hydrogen bonds into chains along [100]. These chains are further linked by weak  $\pi$ – $\pi$  interactions with centroid–centroid distances in the range of 3.609 (2)–3.758 (1) Å, forming a three-dimensional supramolecular network.

## cyclo-Tetrakis( $\mu$ -naphthalene-1,8-dicarboxylato)tetrakis[diaqua(2,2'-bipyridine)-manganese(II)] tetrahydrate

Ling Chen

### S1. Comment

Presently, our studies are focused on selecting suitable multidentate ligands to construct novel coordination architectures. 1,8-Naphthalenecarboxylic anhydride, which is can be hydrolysed to naphthalene-1,8-dicarboxylate(1,8-nap) under hydrothermal conditions, is a versatile building block which can be used to construct interesting structures due to the potential variety of bridging abilities. Some complexes containing 1,8-nap have already been reported (Fu *et al.*, 2010; Feng *et al.*, 2008; Wen *et al.*, 2008; Wen *et al.*, 2007). Herein, we report a new Mn(II) complex containing a 1,8-nap ligand,  $[\text{Mn}_4(1,8\text{-nap})_4(2,2'\text{-bipy})_4(\text{H}_2\text{O})_8].4(\text{H}_2\text{O})$ , (I).

The molecular structure of (I) is shown in Fig. 1. The formula unit consists of four Mn atoms, four 1,8-nap anions, eight coordinated water molecules, two 2,2'-bipy and four lattice water molecules. Unique atoms Mn1 and Mn2 are six-coordinated and have slightly distorted octahedral coordination environments formed by two 1,8-nap ligands, two N atoms from one 2,2'-bipy and two water molecules. All carboxylate groups of the 1,8-nap ligands are deprotonated, and adopt a monodentate coordination mode. Each 1,8-nap ligand links two Mn<sup>II</sup> ions and hence each Mn<sup>II</sup> ion coordinates to two 1,8-nap ligands to form a  $[\text{Mn}_4(1,8\text{-nap})_4]$  neutral ring. Four 2,2'-bipy ligands are oriented to the outer side of the ring while the aqua ligands point to the inside of the ring.

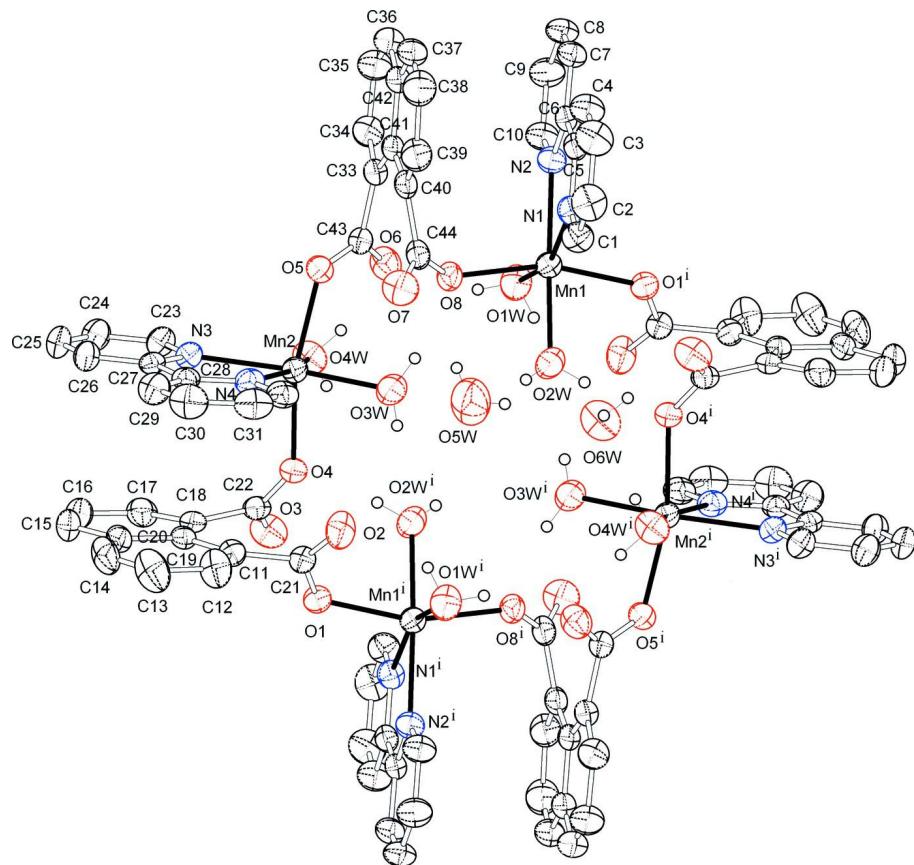

In the crystal structure, (Fig. 2) intermolecular O—H···O hydrogen bonds involving coordinated water molecules, solvent water molecules and carboxylate group oxygen atoms, link molecules to form a one-dimensional chain along [100]. In addition, weak  $\pi$ – $\pi$  interactions with centroid-centroid distance in the range of 3.609 (2) to 3.758 (1) Å between symmetry related 2,2'-bipy ligands lead to the formation of a three-dimensional network.

### S2. Experimental

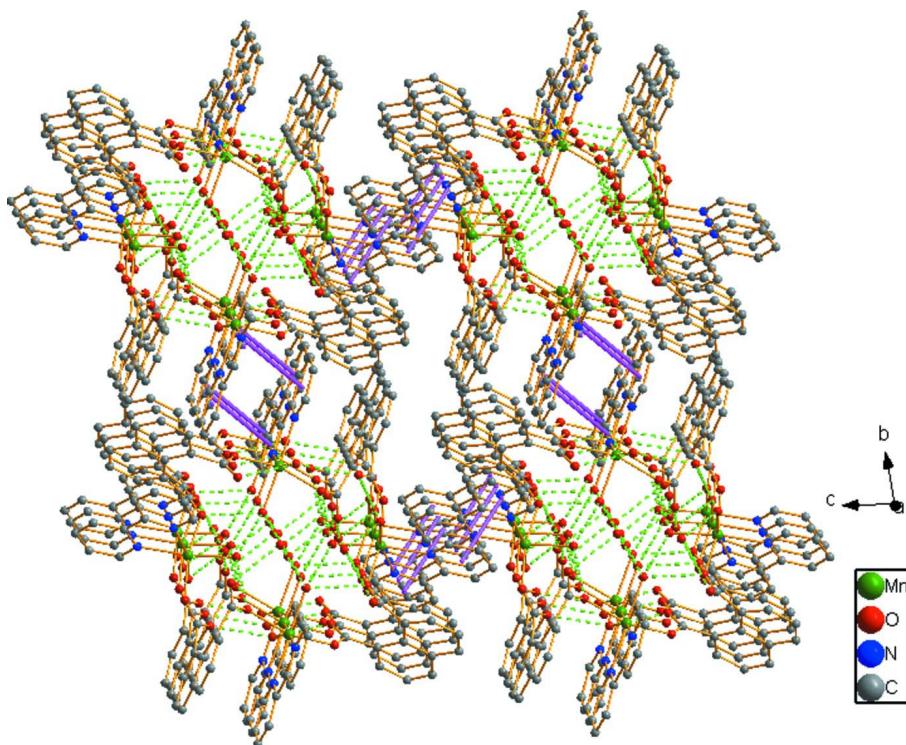

A mixture of MnCl<sub>2</sub>(0.1003 g, 0.5 mmol), naphthalene-1,8-dicarboxylic anhydride (0.0991 g, 0.5 mmol), NaOH (0.0402 g, 1 mmol) and 2,2'-bipyridine (0.0378 g, 0.25 mmol) and ethanol-water (15 ml, V/V, 1:2) was sealed in a 25 ml stainless steel reactor with a Teflon liner and heated at 433 K for 72 h. On completion of the reaction, the reactor was cooled slowly to room temperature and the mixture was filtered, giving colourless block-shaped single crystals suitable for X-ray analysis.

### S3. Refinement

H-atoms were positioned geometrically and included in the refinement using a riding-model approximation [C—H = 0.93 and O—H = 'as found' positions] with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.5U_{\text{eq}}(\text{O})$ .

**Figure 1**

The molecular structure of (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. [Symmetry codes: (i)  $-x+1, -y+1, -z+1$ ]

**Figure 2**

Part of the crystal structure with green dashed lines to show the donor-acceptor distances of hydrogen bonds (H atoms are not shown) and pink lines to show the  $\pi-\pi$  interactions.

$$\text{where } P = (F_o^2 + 2F_c^2)/3$$

$$(\Delta/\sigma)_{\max} = 0.001$$

$$\Delta\rho_{\max} = 0.50 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.41 \text{ e \AA}^{-3}$$

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
