Received 20 December 2010; accepted 21 December 2010

Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.053 ; w R$ factor $=0.135 ;$ data-to-parameter ratio $=13.5$.

In the crystal structure of the title compound, $\mathrm{C}_{10} \mathrm{H}_{11} \mathrm{NO}_{3}$, the conformations of $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds in the amide segment are anti to each other. Further, the conformations of the amide O atom and the carbonyl O atom of the acid segment are anti to each other and to the adjacent $-\mathrm{CH}_{2}$ groups. The $\mathrm{C}=\mathrm{O}$ and $\mathrm{O}-\mathrm{H}$ bonds of the acid group are in syn positions with respect to each other. In the crystal, the molecules are packed into infinite chains along the $a$ axis through intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds.

## $N$-Phenylsuccinamic acid

B. Thimme Gowda, Sabine Foro, B. S. Saraswathi and Hartmut Fuess

## S1. Comment

As a part of studying the effect of ring and side chain substitutions on the crystal structures of anilides (Gowda et al., 2009; 2010a,b), the crystal structure of $N$-(phenyl)succinamic acid (I) has been determined. The conformations of $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds in the amide segment are anti to each other. The conformation of the amide oxygen and the carbonyl oxygen of the acid segment are also anti to each other, similar to that observed in $N$-(2-chlorophenyl)succinamic acid (II) (Gowda et al., 2009) and $N$-(2-methylphenyl)succinamic acid (III)(Gowda et al., 2010b), but contrary to the syn conformation observed in $N$-(3-methylphenyl)succinamic acid (IV) and $N$-(3-chlorophenyl)succinamic acid (V) (Gowda et al., 2010a). Further, the conformation of both the $\mathrm{C}=\mathrm{O}$ bonds are anti to the H atoms of their adjacent $-\mathrm{CH}_{2}$ groups (Fig. 1) and the $\mathrm{C}=\mathrm{O}$ and $\mathrm{O}-\mathrm{H}$ bonds of the acid group are in syn position to each other, similar to that observed in (II), (III), (IV) and (V).

The $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ intermolecular hydrogen bonds pack the molecules into infinite chains in the structure (Table 1, Fig.2).
The modes of interlinking carboxylic acids by hydrogen bonds is described elsewhere (Leiserowitz, 1976). The packing of molecules involving dimeric hydrogen bonded association of each carboxyl group with a centrosymmetrically related neighbor has also been observed (Jagannathan et al., 1994).

## S2. Experimental

The solution of succinic anhydride ( 0.01 mole ) in toluene $(25 \mathrm{ml})$ was treated dropwise with the solution of aniline $(0.01$ mole) also in toluene ( 20 ml ) with constant stirring. The resulting mixture was stirred for about one h and set aside for an additional hour at room temperature for completion of the reaction. The mixture was then treated with dilute hydrochloric acid to remove the unreacted aniline. The resultant solid $N$-(phenyl)succinamic acid was filtered under suction and washed thoroughly with water to remove the unreacted succinic anhydride and succinic acid. It was recrystallized to constant melting point from ethanol. The purity of the compound was checked by elemental analysis and characterized by its infrared and NMR spectra.
Prism like colorless single crystals used in x-ray diffraction studies were grown in ethanolic solution by slow evaporation at room temperature.

## S3. Refinement

The H atoms of the NH and OH group were located in a difference map and later restrained to the distance $\mathrm{N}-\mathrm{H}=0.86$ (2) $\AA$ and $\mathrm{O}-\mathrm{H}=0.82$ (2) $\AA$. The other H atoms were positioned with idealized geometry using a riding model with $\mathrm{C}-$ $\mathrm{H}=0.93-0.97 \AA$. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the $U_{\text {eq }}$ of the parent atom).

## Figure 1

Molecular structure of the title compound, showing the atom labeling scheme. The displacement ellipsoids are drawn at the $50 \%$ probability level.

Figure 2
Molecular packing of the title compound with hydrogen bonding shown as dashed lines.

## Special details

Experimental. CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
