Received 31 December 2010; accepted 18 January 2011

Key indicators: single-crystal X-ray study; $T=133 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.043 ; w R$ factor $=0.106$; data-to-parameter ratio $=13.0$.

In the title compound, $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}_{3}$, the nitro group is twisted with respect to the amide group, with $\mathrm{C}-\mathrm{N}-\mathrm{N}-\mathrm{O}$ torsion angles of $29.0(2)$ and $-153.66(14)^{\circ}$. In the crystal, molecules are linked through intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ and $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming supramolecular chains along the $a$ axis. These chains stack in parallel and form distinct layer motifs in the (001) plane.

# N -Nitro-1 H -pyrrole-2-carboxamide <br> Long Liu, Chunlin He, Zengxi Li, Chunshan Li, Xiangping Zhang and Suojiang Zhang 

## S1. Comment

Pyrrole derivatives play an important role in heterocyclic chemistry due to their intrinsic biological activities as antimicrobial agents (Mohamed et al., 2009). The structures of these compounds have been reported extensively, such as 2,3,5-substituted pyrrole derivatives (Ferreira et al., 2002), 1-Benzyl- $N$-methyl-1 H -pyrrole-2-carboxamide (Zeng et al., 2010), 2-(4,5-dibromo-1H-pyrrole-2-carboxamido) propionate (Zeng et al., 2007) and Tetraethyl 1,1'-(ethane-1,2-diyl)bis(2,5-dimethyl-1H-pyrrole-3,4-dicarboxylate) (Wang et al., 2010).
The bond length of $\mathrm{N} 2-\mathrm{C} 5$ for the title compound (1.404(2) $\AA$ ) is about $0.07 \AA$ longer than compound 1-Benzyl- $N$ -methyl-1H-pyrrole-2-carboxamide (1.334 (3) Å) (Zeng et al., 2010) (Fig. 1). The unit is nearly co-planar with the twist happens at nitro group ( $\mathrm{C} 5-\mathrm{N} 2-\mathrm{N} 3-\mathrm{O} 2=29.0(2), \mathrm{C} 5-\mathrm{N} 2-\mathrm{N} 3-\mathrm{O} 3=-153.66(14)$ ), the maximum deviation of other torsions is $\mathrm{C} 3-\mathrm{C} 4-\mathrm{C} 5-\mathrm{N} 2=-8.6(3)^{\circ}$.
In the crystal structure (Fig. 2), molecules are connected through $\mathrm{N} 1-\mathrm{H} 1 \mathrm{~N} \cdots \mathrm{O} 3, \mathrm{~N} 2-\mathrm{H} 2 \mathrm{~N} \cdots \mathrm{O} 1, \mathrm{C} 3-\mathrm{H} 3 \cdots \mathrm{O} 1, \mathrm{C} 3-$ H3 $\cdots$ O3 (Table 1) hydrogen bonds to form one-dimensional supramolecular chains along the $a$ axis. These supramolecular chains stack in parallel and form distinct layer motif in (001) plane.

## S2. Experimental

Pyrrole ( $0.67 \mathrm{~g}, 0.01 \mathrm{~mol}$ ) was added to a solution of $N, N^{\prime}$-dinitrourea (DNU) ( $1.5 \mathrm{~g}, 0.01 \mathrm{~mol}$ ) dissolved in acetonitrile $(10 \mathrm{ml})$, stirred at room temperature for 24 h , the crude compound was obtained after acetonitrile was evaporated. Then the products were dissoved in ethyl acetate, colourless crystals suitable for X-ray crystal diffraction were obtained by slow evaporation of the solution at room temperature. DNU was synthesized according to the literautre (Goede et al., 2001).

## S3. Refinement

The hydrogen atoms bonded to N 1 and N 2 were located from a difference Fourier maps and refined isotropically with N $-\mathrm{H}=0.88$ (3) $\AA$ and 0.88 (2) $\AA$ ( respectively. The remaining hydrogen atoms were geometrically positioned (all $\mathrm{C}-\mathrm{H}=$ $0.9500 \AA$ ).

Figure 1
Thermal ellipsoid plot of $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}_{3}$ at the $50 \%$ probability level; Hydrogen atoms are drawn as spheres of arbitrary radius.

Figure 2
Hydrogen-bonded layer structure.

Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0596 P)^{2}+0.536 P\right]$ where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.34 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-0.15 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
