## 1H-Pyrrole-2-carbohydrazide

Lina Wang, Xiangrong Liu,* Chun Yang, Shunsheng Zhao and Kanshe Li

College of Chemistry and Chemical Engineering, Xi'an University of Science \&
Technology, Xi'an 710054, People's Republic of China
Correspondence e-mail: xkchemistry@yahoo.com.cn
Received 7 January 2011; accepted 19 January 2011
Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.043 ; w R$ factor $=0.146$; data-to-parameter ratio $=11.6$.

The title compound, $\mathrm{C}_{5} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}$, was obtained by the reaction of ethyl 1 H -pyrrol-2-carboxylate and hydrazide hydrate. In the crystal, molecules are linked via intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{N}$ and $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming a supramolecular grid.

## 1H-Pyrrole-2-carbohydrazide

Lina Wang, Xiangrong Liu, Chun Yang, Shunsheng Zhao and Kanshe Li

## S1. Comment

Pyrrole is one of the most ubiquitous heterocycles in the plant and animal kingdom because of its participation as a subunit of chlorophyll in plant cells and hemin and vitamin B12 in animal cells (Joshi et al., 2008). Pyrrole and its derivatives have shown to possess biological activities such as antibacterial (Demirayak et al., 1999), antitumor (Halazy et al., 1984), analgesics, antitubercular (Bijev, 2006), anti-inflammatory, and antiallergic (Sbardella et al., 2004). Several macromolecular antibiotics having pyrrole structure were isolated from biological sources and their activities were defined.
The molecular structure for 2-pyrrole hydrazide is shown in Fig. 1. The crystal structure is stabilized by N1—H1 $\cdots \mathrm{N} 3$, $\mathrm{N} 2-\mathrm{H} 2 \cdots \mathrm{O} 1$ and $\mathrm{N} 3-\mathrm{H} 3 \mathrm{~B} \cdots \mathrm{O} 1$ hydrogen bonds, as shown in Fig. 2 and Table 1.
In addition, as shown in Fig.3, the packing diagram of the title compound looks like the wave viewed down the $a$ axis.

## S2. Experimental

To a 25 mL round-bottomed flask equipped with a magnetic stirrer, 0.5 mL of hydrazine hydrate ( $80 \%$ in water) and 0.1392 g of 1 H -pyrrol-2-carboxlic acid ethyl ester ( 1 mmol ) were added. Then the temperature of the mixture was elevated to $70^{\circ} \mathrm{C}$ for 45 min and the mixture was cooled to room temperature. The formed suspension was filtered off, washed with $\mathrm{Et}_{2} \mathrm{O}$, and recrystallized from absolute ethyl alcohol. 0.113 g of the hydrazide was obtained with a yield of 90\%.

## S3. Refinement

H atoms attached to N 3 were located in a difference Fourier map. All other H atoms were placed at calculated positions and all were refined in riding model, with $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}-\mathrm{H}$ distances in the range of 0.86 and $0.93 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}$ of the attached N and C atoms.

Figure 1
The molecular structure for 2-pyrrole hydrazide, with atom labels and $50 \%$ probability displacement ellipsoids for non-H atoms.

Figure 2
View of the hydrogen bonds for 2-pyrrole hydrazide, H atoms not involved in hydrogen bonding have been omitted.

Figure 3
The packing for 2-pyrrole hydrazide, viewed down the $a$ axis.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.043$
$w R\left(F^{2}\right)=0.146$
$S=1.04$
1043 reflections
90 parameters
0 restraints
Primary atom site location: structure-invariant direct methods

> Secondary atom site location: difference Fourier map
> Hydrogen site location: inferred from neighbouring sites
> H atoms treated by a mixture of independent and constrained refinement
> $w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}^{2}\right)+(0.0957 P)^{2}\right]$ where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
> $(\Delta / \sigma)_{\text {max }}<0.001$
> $\Delta \rho_{\text {max }}=0.16$ e $\AA^{-3}$
> $\Delta \rho_{\text {min }}=-0.21 \mathrm{e} \AA^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving 1.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
