Received 22 December 2010; accepted 11 January 2011

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.003$ Å; R factor = 0.028; wR factor = 0.072; data-to-parameter ratio = 16.0.

The title dinitrosyl iron diphosphane complex, $[\text{Fe}(\text{NO})_2(\text{C}_{18}\text{H}_{12}\text{Cl}_3\text{P})_2]$ or $\text{Fe}(\text{NO})_2L_2$ [$L = \text{P}(\text{C}_6\text{H}_4-p\text{-Cl})_3$] belongs to the family of metal dinitrosyl compounds with the general formula $\text{Fe}(\text{NO})_2(L)_x$, referred to collectively as dinitrosyl iron compounds (DNICs). The iron atom is tetrahedrally coordinated by two phosphane ligands and two NO groups with $\text{Fe}-\text{N}-\text{O}$ bond angles of 178.76 (15) and 177.67 (14)°.

Dinitrosylbis[tris(4-chlorophenyl)phosphane]iron

Myron W. Jones, Douglas R. Powell and George B. Richter-Addo

S1. Comment

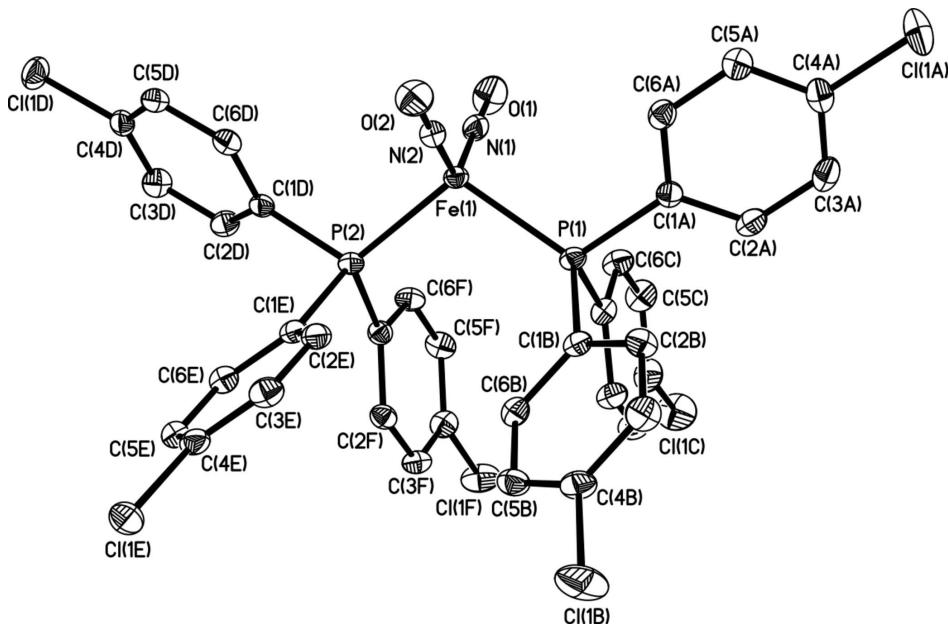

The molecular structure of the title compound is shown in Fig. 1. The molecule possesses a distorted tetrahedral geometry around the iron center. The iron is bound to two nitrosyl groups *via* the nitrogen atoms and to two phosphane ligands *via* the phosphorous atoms. The $\text{Fe}(\text{NO})_2$ group exhibits an *attracto* conformation where the bond angles $\text{O}\cdots\text{Fe}\cdots\text{O} < \text{N}=\text{Fe}=\text{N}$ (Richter-Addo & Legzdins, 1992). The $\text{N}=\text{Fe}=\text{N}$ bond angle is $127.78(7)^\circ$ and the interphosphane angle, $\text{P}=\text{Fe}=\text{P}$, is $106.80(3)^\circ$. The $\text{Fe}=\text{N}=\text{O}$ bond angles are $178.76(15)^\circ$ and $177.67(14)^\circ$. For the structures of some related complexes, see: Li *et al.*, 2003, Atkinson *et al.*, 1996, Li Kam Wah *et al.*, 1989, and Albano *et al.* 1974.

S2. Experimental

A colorless toluene solution (4 ml) of $\text{P}(\text{C}_6\text{H}_4-p\text{-Cl})_3$ (126 mg, 0.35 mmol) was charged with $\text{Fe}(\text{NO})_2(\text{CO})_2$ ($20\ \mu\text{L}$, 0.18 mmol) (Eisch & King, 1965). The light red solution was heated and stirred under nitrogen. After 20 min the color of the solution had changed to black/brown. The reaction was allowed to proceed for 3.5 h until the infrared spectrum indicated the absence of characteristic carbonyl stretching frequencies for $\text{Fe}(\text{NO})_2(\text{CO})_2$ ($\nu_{\text{CO}} = 2090\ \text{cm}^{-1}$ and $2040\ \text{cm}^{-1}$). The reaction mixture was filtered through celite under N_2 and the solvent was subsequently removed under vacuum. Isolated yield of the $\text{Fe}(\text{NO})_2\text{L}_2$ compound: 33%. IR (toluene, cm^{-1}): $\nu_{\text{NO}} = 1722\ \text{s}$ and $1682\ \text{s}$. $^{31}\text{P}\{\text{H}\}$ NMR (CDCl_3): $\delta = 60.9\ (\text{s})$ referenced to 85% H_3PO_4 . Suitable crystals for X-ray diffraction studies were grown by slow evaporation of a chloroform solution of the complex under nitrogen at ambient temperature.

S3. Refinement

H atoms were placed using known geometry with C—H (phenyl = $0.95\ \text{\AA}$, methyl = $0.98\ \text{\AA}$). Displacement parameters of phenyl H atoms were set to 1.2 times the isotropic equivalent for the bonded C.

**Figure 1**

The molecular structure of the title compound. Hydrogen atoms have been omitted for clarity. The displacement ellipsoids are drawn at the 50% probability level.
