### S1. Comment

16-Isopropyl-5,9-dimethyltetracyclo[10.2.2.0<sup>1,10</sup>.0<sup>4,9</sup>]hexadec-15-ene-5,14-dicarboxylic acid was isolated from acrylic modified rosin (Aldrich, 1971), and its crystal structure has been reported previously (Wang *et al.*, 2009). The title compound was obtained on reduction of this dicarboxylic acid.

The molecular structure of one of the independent molecules of the title compound is shown in Fig. 1. The asymmetric unit consists of four crystallographically independent molecules (Fig. 2).

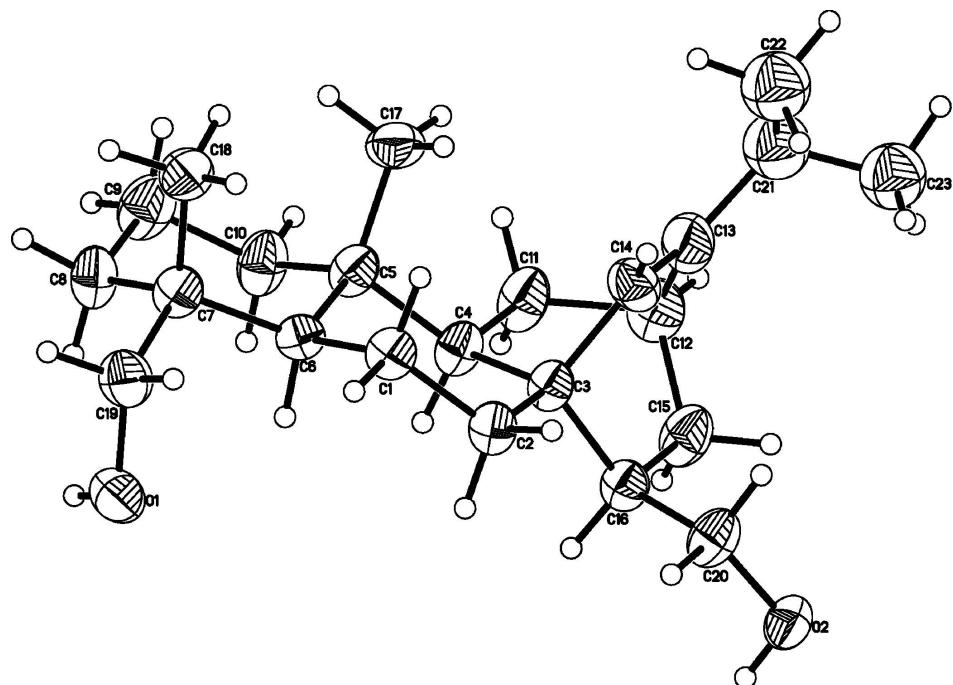

In the crystal the independent molecules are linked via O—H···O hydrogen bonds (Table 1), to form a polymer chain propagating in [100], as illustrated in Fig. 3.

### S2. Experimental

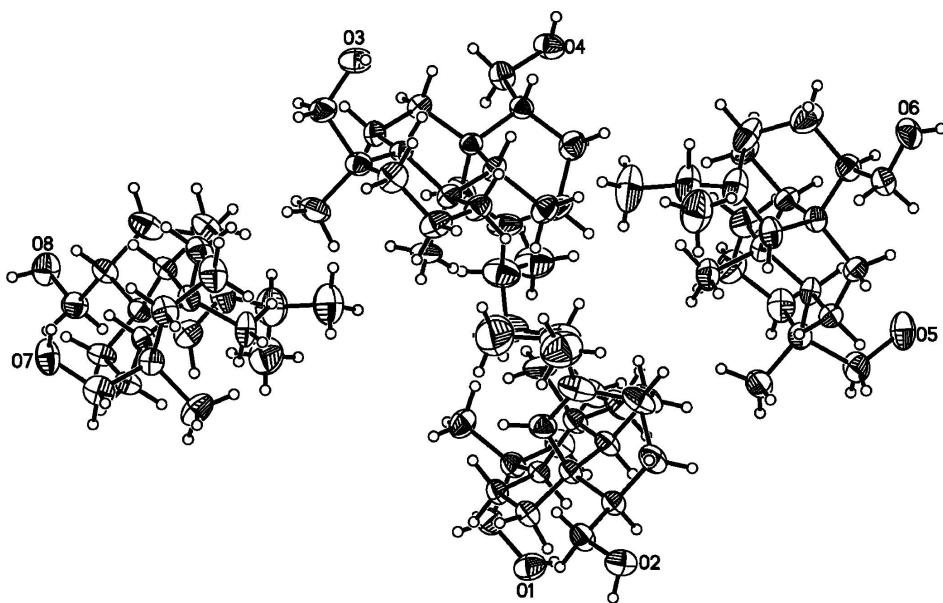

16-Isopropyl-5,9-dimethyltetracyclo[10.2.2.0<sup>1,10</sup>.0<sup>4,9</sup>]hexadec-15-ene-5,14-dicarboxylic acid was (20.0 g) dissolved in tetrahydrofuran (300 ml) at 263 K while stirring vigorously, lithium aluminium hydride (8.1 g) was added in batch within 2 h. The reaction was maintained during 1 h at the temperature of reflux, then water (8.1 ml) and 10% sodium hydroxide solution(8.1 ml) were added drop wise at 263 K. The mixture was then filtered and the filtrate was concentrated. The crude product was recrystallized with ethanol, giving the title compound. Crystals, suitable for X-ray diffraction, were obtained by slow evaporation of an ethanol solution.

### S3. Refinement

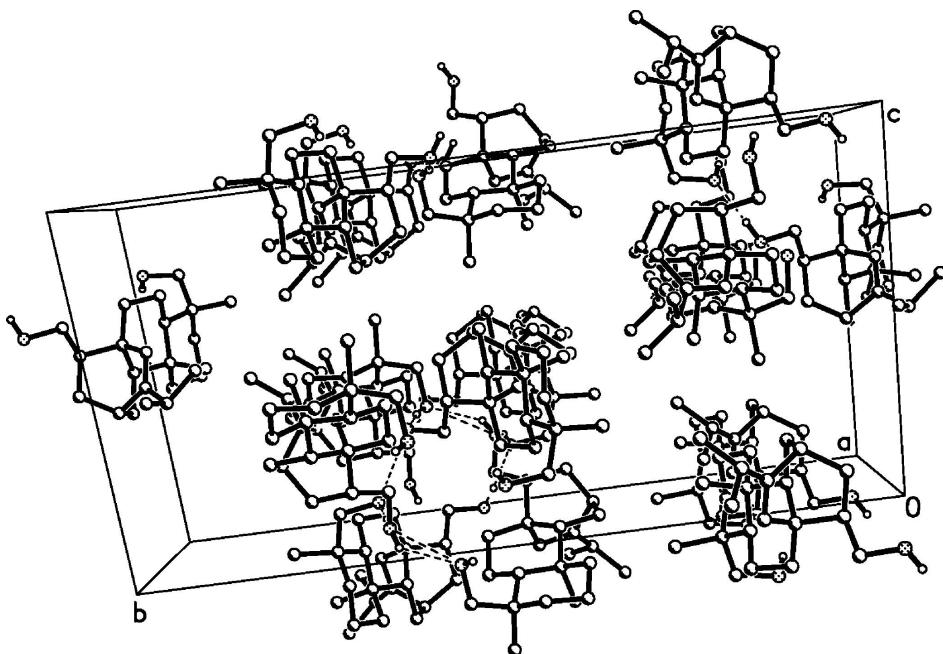

Only one equivalent of the diffraction data was measured and the absolute structure of the molecules in the crystal are unknown. The structure contains solvent accessible voids of 47 Å<sup>3</sup> which could possibly be a disordered water molecule. It was not taken into consideration when refining the crystal structure. The C-C bonds of the isopropyl groups were refined with distance restraints of 1.50 (2) Å. The OH and the C-bound H-atoms were included in calculated positions and treated as riding atoms: O-H = 0.82 - 0.85 Å, C-H = 0.96, 0.9 and 0.98 Å for CH~3~, CH<sub>2</sub> and CH H-atoms, respectively, with  $U_{\text{iso}}(\text{H}) = k \times U_{\text{eq}}$  of the carrier atom, where k = 1.5 for OH and CH<sub>3</sub> H-atoms and 1.2 for all other H-atoms.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
