Received 11 February 2011; accepted 20 February 2011

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.043; wR factor = 0.123; data-to-parameter ratio = 12.6.

In the crystal structure of the title compound, $\text{C}_{11}\text{H}_{11}\text{NO}_3\text{S}$, the molecules are linked by intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen-bond interactions. The heterocyclic thiazine ring adopts a conformation intermediate between twist and boat.

Methyl 2-(3-oxo-3,4-dihydro-2H-1,4-benzothiazin-4-yl)acetate

Yamna Barryala, Stéphane Massip, Saïd Lazar, El Mokhtar Essassi and Hafid Zouihri

S1. Comment

Several derivatives of benzothiazines, particularly those carrying a keto group on the thiazine part of the molecule, show stimulant and antidepressant activity. [Lopatina *et al.* 1982].

The goal of the present work was the synthesis, the crystal structure determination and the biological teste of the methyl (3-oxo-2,3-dihydro-4H-1,4-benzothiazin-4-yl)acetate. [Harmata *et al.* 2005].

In the crystal structure of the title compound (Fig. 1), the molecules exhibit C···H—O intermolecular H-bonds interactions (Fig. 2). The heterocyclic thiazine ring adopt half-chair conformation with the S and N atoms displaced by 0.357 (5) and 0.304 (15) Å, respectively, on the opposite sides from the mean plane formed by the remaining ring atoms. The methyl acetate group, which is almost planar with the r. m.s deviaton of 0.042 (14) Å, is inclined at dihedral angle of 88.31 (9)° and 74.67 (9)° with respect to the thiazine and benzene ring respectively.

The dihedral angle between the aromatic benzene ring C1–C6 and thiazine ring C5/C6/N7/C8/C9/S10 is 17.02 (9)° while the methyl acetate group C12/C13/O14/O15/C16 is oriented at dihedral angle of 81.30 (8)° with respect to the benzothiazine ring.

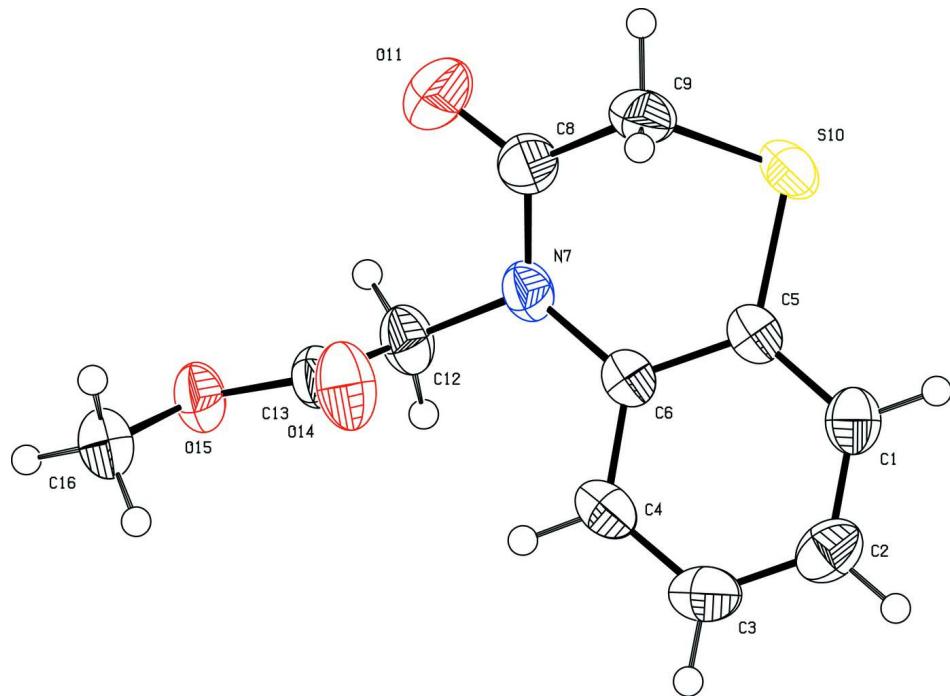

In the title compound (Fig. 1), the bond distances and angles agree with the corresponding bond distances and angles reported in related compounds [Saeed *et al.* 2010 and Aouine *et al.* 2010].

S2. Experimental

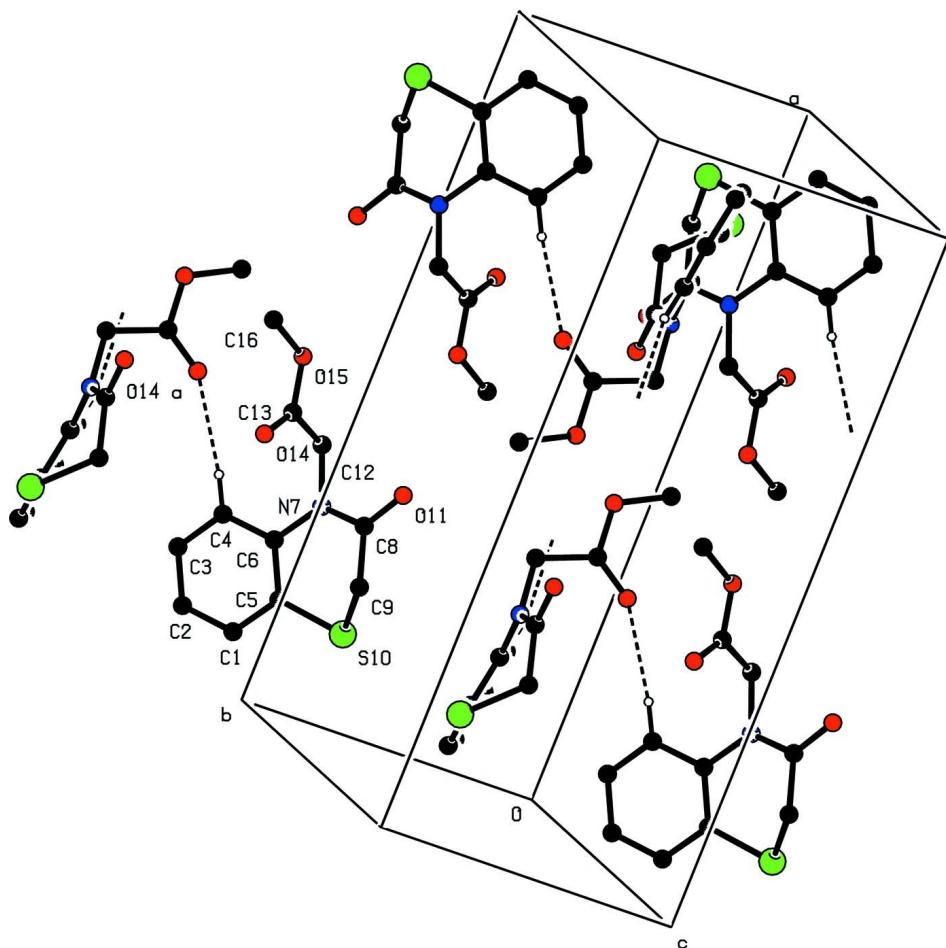

To 1,4-benzothiazin-3-one (0.25 g, 1.5 mmol), potassium carbonate (0.41 g, 3 mmol), in ketone (15 ml) was added methyl chloroacetate (0.32 g, 3 mmol). The mixture was heated to reflux for 48 h. The salts were removed by filtration and the filtrate concentrated under reduced pressure. The residue was separated by chromatography on a column of silica gel with dichloromethane/diethyl ether (9/1) as eluent. Crystals were isolated when the solvent was allowed to evaporate.

S3. Refinement

All H atoms were fixed geometrically and treated as riding with C—H = 0.97 Å (methyne) and 0.93 Å (aromatic) with U_{iso}(H) = 1.2U_{eq}(C).

**Figure 1**

Molecular view of the title compound showing the atom-labeling scheme. Displacement ellipsoids are drawn at the 50% probability level. H atoms are represented as small spheres of arbitrary radii.

**Figure 2**

Partial packing view showing the chain formed by C—H···O hydrogen bondings. H atoms not involved in hydrogen bonds have been omitted for clarity.

 H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0891P)^2 + 0.2952P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\text{max}} < 0.001$
 $\Delta\rho_{\text{max}} = 0.31 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\text{min}} = -0.28 \text{ e } \text{\AA}^{-3}$
 Extinction correction: *SHELXL97* (Sheldrick, 2008), $Fc^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$
 Extinction coefficient: 0.025 (2)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
