Received 3 February 2011; accepted 4 February 2011

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.036;  $wR$  factor = 0.102; data-to-parameter ratio = 16.7.

In the title compound,  $\text{C}_{10}\text{H}_{12}\text{ClNO}_3\text{S}$ , the amide H atom is *syn* with respect to the *ortho*-chloro group in the benzene ring and the  $\text{C}-\text{S}-\text{N}-\text{C}$  torsion angle is  $64.35(16)^\circ$ . The benzene ring and the  $\text{SO}_2-\text{NH}-\text{CO}-\text{C}$  segment form a dihedral angle of  $87.4(1)^\circ$ . The crystal structure features inversion-related dimers linked by pairs of  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds.

## N-(2-Chlorophenylsulfonyl)-2-methylpropanamide

K. Shakuntala, Sabine Foro and B. Thimme Gowda

### S1. Comment

The molecular structures of sulfonamide drugs contain the sulfanilamide moiety (Maren, 1976). The affinity for hydrogen bonding in the solid state due to the presence of various hydrogen bond donors and acceptors can give rise to polymorphism (Yang & Guillory, 1972). The hydrogen bonding preferences of sulfonamides has also been investigated (Adsmond & Grant, 2001). The nature and position of substituents play a significant role on the crystal structures of N-(aryl)sulfonoamides (Gowda *et al.*, 2008, 2009, 2010). As a part of studying the substituent effects on the structures of this class of compounds, the structure of *N*-(2-chlorophenylsulfonyl)-2,2-dimethylacetamide (I) has been determined. The conformations of the N—H and C=O bonds of the SO<sub>2</sub>—NH—CO—C segment in the structure are anti to each other (Fig. 1), similar to that observed in *N*-(phenylsulfonyl)-acetamide (II) (Gowda *et al.*, 2010), 2,2-dimethyl-*N*-(phenylsulfonyl)-acetamide (III) (Gowda *et al.*, 2009) and 2,2-dichloro-*N*-(phenylsulfonyl)-acetamide (IV) (Gowda *et al.*, 2008).

The molecule in (I) is bent at the S-atom with a C1—S1—N1—C7 torsion angle of 64.4 (2) $^{\circ}$ , compared to the values of -58.8 (4) $^{\circ}$  in (II), 67.1 (3) $^{\circ}$  in (III) and -66.3 (3) $^{\circ}$  in (IV). Further, the dihedral angle between the benzene ring and the SO<sub>2</sub>—NH—CO—C group in (I) is 87.4 (1) $^{\circ}$ , compared to the values of 89.0 (2) $^{\circ}$  in (II), 87.4 (1) $^{\circ}$  in (III) and 79.8 (1) $^{\circ}$  in (IV),

In the crystal structure, the intermolecular N—H $\cdots$ O hydrogen bonds (Table 1) link the molecules through inversion-related dimers into zigzag chains in the *bc*-plane. Part of the crystal structure is shown in Fig. 2.

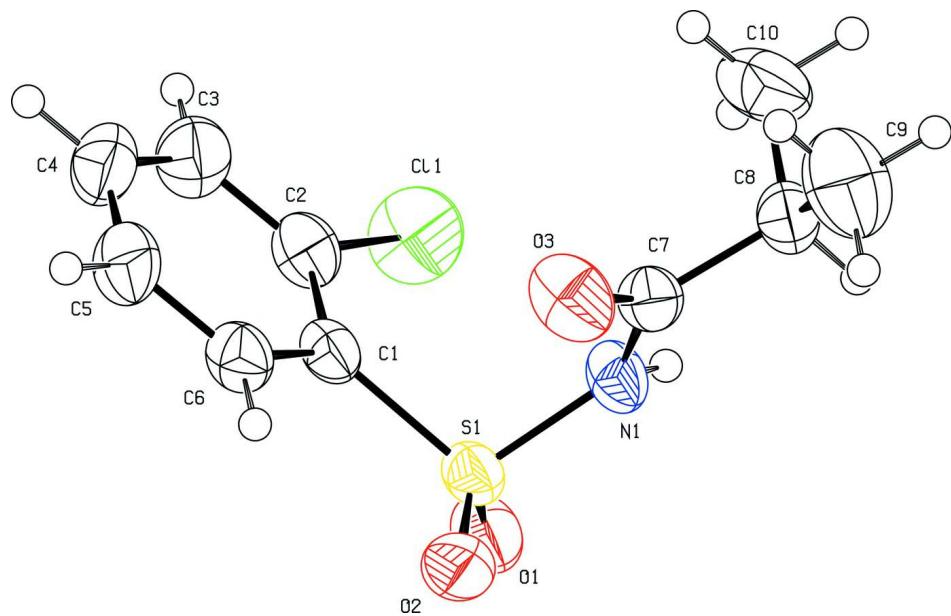

### S2. Experimental

The title compound was prepared by refluxing 2-chlorobenzenesulfonamide (0.10 mole) with an excess of 2,2-dimethyl-acetyl chloride (0.20 mole) for one hour on a water bath. The reaction mixture was cooled and poured into ice cold water. The resulting solid was separated, washed thoroughly with water and dissolved in warm dilute sodium hydrogen carbonate solution. The title compound was reprecipitated by acidifying the filtered solution with glacial acetic acid. It was filtered, dried and recrystallized from ethanol. The purity of the compound was checked by determining its melting point. It was further characterized by recording its infrared spectra.

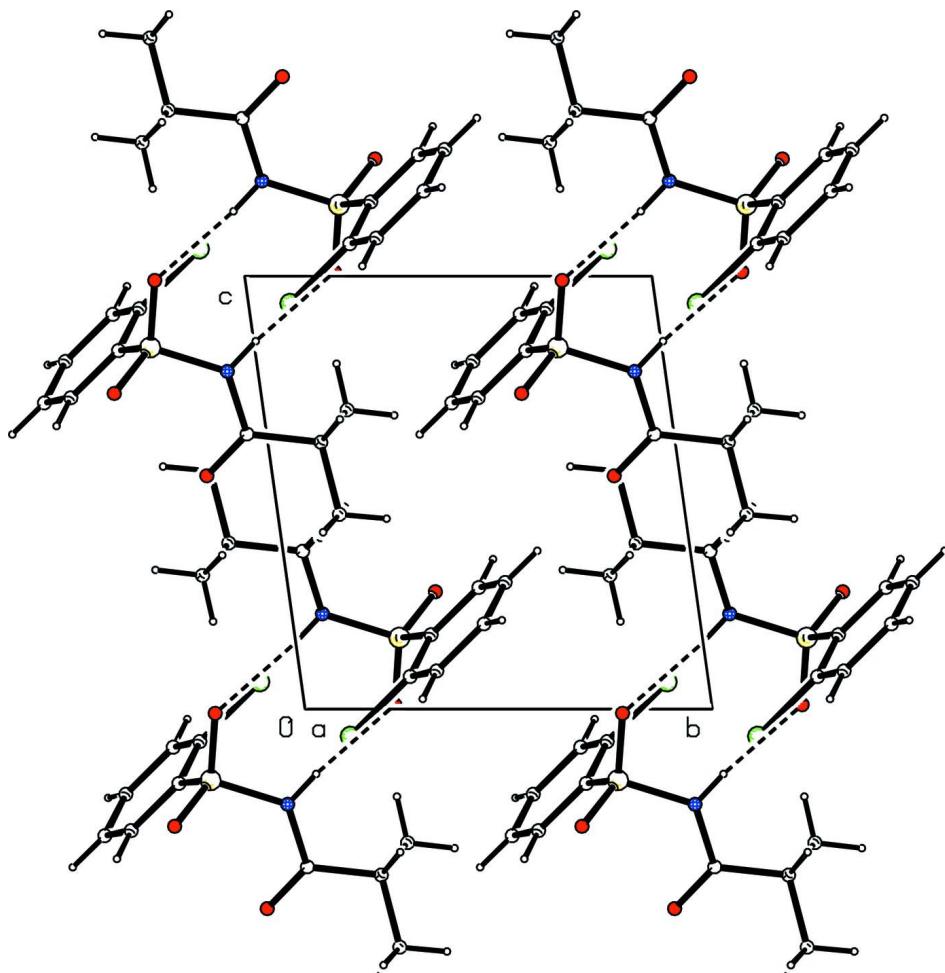

Prism like colorless single crystals of the title compound used in X-ray diffraction studies were obtained from a slow evaporation of an ethanolic solution of the compound.

### S3. Refinement

The H atom of the NH group was located in a difference map and later restrained to the distance N—H = 0.86 (2) Å. The other H atoms were positioned with idealized geometry using a riding model with C—H = 0.93–0.98 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the  $U_{\text{eq}}$  of the parent atom).

**Figure 1**

Molecular structure of the title compound, showing the atom- labelling scheme. Displacement ellipsoids are drawn at the 50% probability level.

**Figure 2**

Molecular packing in the title compound. Hydrogen bonds are shown as dashed lines.

#### Crystal data

$C_{10}H_{12}ClNO_3S$   
 $M_r = 261.72$   
Triclinic,  $P\bar{1}$   
Hall symbol: -P 1  
 $a = 8.365 (1) \text{ \AA}$   
 $b = 8.719 (1) \text{ \AA}$   
 $c = 9.143 (1) \text{ \AA}$   
 $\alpha = 92.74 (1)^\circ$   
 $\beta = 104.22 (1)^\circ$   
 $\gamma = 108.75 (1)^\circ$   
 $V = 606.24 (12) \text{ \AA}^3$

$Z = 2$   
 $F(000) = 272$   
 $D_x = 1.434 \text{ Mg m}^{-3}$   
 $Mo K\alpha$  radiation,  $\lambda = 0.71073 \text{ \AA}$   
Cell parameters from 2678 reflections  
 $\theta = 3.0\text{--}27.7^\circ$   
 $\mu = 0.48 \text{ mm}^{-1}$   
 $T = 293 \text{ K}$   
Prism, colourless  
 $0.45 \times 0.35 \times 0.35 \text{ mm}$

#### Data collection

Oxford Diffraction Xcalibur  
diffractometer with a Sapphire CCD detector  
Radiation source: fine-focus sealed tube  
Graphite monochromator

Rotation method data acquisition using  $\omega$  scans  
Absorption correction: multi-scan  
(*CrysAlis RED*; Oxford Diffraction, 2009)  
 $T_{\min} = 0.814$ ,  $T_{\max} = 0.851$

4031 measured reflections  
 2481 independent reflections  
 2200 reflections with  $I > 2\sigma(I)$   
 $R_{\text{int}} = 0.011$

$\theta_{\max} = 26.4^\circ$ ,  $\theta_{\min} = 3.0^\circ$   
 $h = -10 \rightarrow 10$   
 $k = -10 \rightarrow 9$   
 $l = -11 \rightarrow 11$

#### Refinement

Refinement on  $F^2$   
 Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.036$   
 $wR(F^2) = 0.102$   
 $S = 1.04$   
 2481 reflections  
 149 parameters  
 1 restraint  
 Primary atom site location: structure-invariant direct methods  
 Secondary atom site location: difference Fourier map

Hydrogen site location: inferred from neighbouring sites  
 H atoms treated by a mixture of independent and constrained refinement  
 $w = 1/[\sigma^2(F_o^2) + (0.0589P)^2 + 0.1796P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.39 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.27 \text{ e } \text{\AA}^{-3}$   
 Extinction correction: *SHELXL97* (Sheldrick, 2008),  $Fc^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{-1/4}$   
 Extinction coefficient: 0.074 (7)

#### Special details

**Experimental.** CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
