Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.058;  $wR$  factor = 0.119; data-to-parameter ratio = 14.1.

In the title compound,  $\text{C}_{16}\text{H}_{14}\text{BrN}_3\text{O}_2\text{S}$ , the atoms of the 1,3-thiazolidine group, except for the N and the C atoms attached to the bromobenzene ring, are disordered over two sets of sites with occupancies of 0.605 (13) and 0.395 (13). The benzene and pyridine rings make a dihedral angle of  $86.2(2)^\circ$ . In the crystal, molecules are linked by intermolecular N—H···N and C—H···O hydrogen bonds, forming a three-dimensional network. Furthermore, there is a  $\pi$ — $\pi$  stacking interaction [centroid–centroid distance =  $3.758(2)\text{ \AA}$ ] between the pyridine and benzene rings.

### S1. Comment

Pyridine-3-carboxamides have gained attention because of their diverse pharmacological properties such as anti-inflammatory (Abdel-Alim *et al.*, 2005), anticancer (Girgis *et al.* 2006), cytoprotective (Slominska *et al.*, 2008), and anxiolytic (Spanka *et al.*, 2010) activities. 4-Thiazolidinone derivatives have antineoplastic (Vigorita *et al.*, 1992), HIV-1 RT inhibitory (Barreca *et al.*, 2003; Rao *et al.*, 2004), hypolipidemic (Jacop & Kutty, 2004), and anti-inflammatory (Kalia *et al.*, 2007) activities. In an effort to evaluate bioactive molecules bearing both 4-thiazolidinone and pyridine-3-carboxamide scaffolds together, we synthesized *N*-(thiazolidin-3-yl)pyridine-3-carboxamide derivatives to examine their antiviral and anticancer properties.

In the 1,3-thiazolidine group of the title molecule (Fig. 1), all except the N1 and C7 atoms are disordered. The dihedral angle between the ring planes (S1A/N1/C7/C8A/C9A and S1B/N1/C7/C8B/C9B) formed by the major and minor disorder components is 18.5 (8) °.

The benzene (C1–C6) and pyridine (N3/C12–C16) rings make a dihedral angle of 86.21 (19) ° with each other. The N1—N2—C11—C12, N1—N2—C11—O2, N2—C11—C12—C13 and O2—C11—C12—C13 torsion angles are 180.0 (3), 1.2 (6), 172.2 (3) and -9.0 (6)°, respectively.

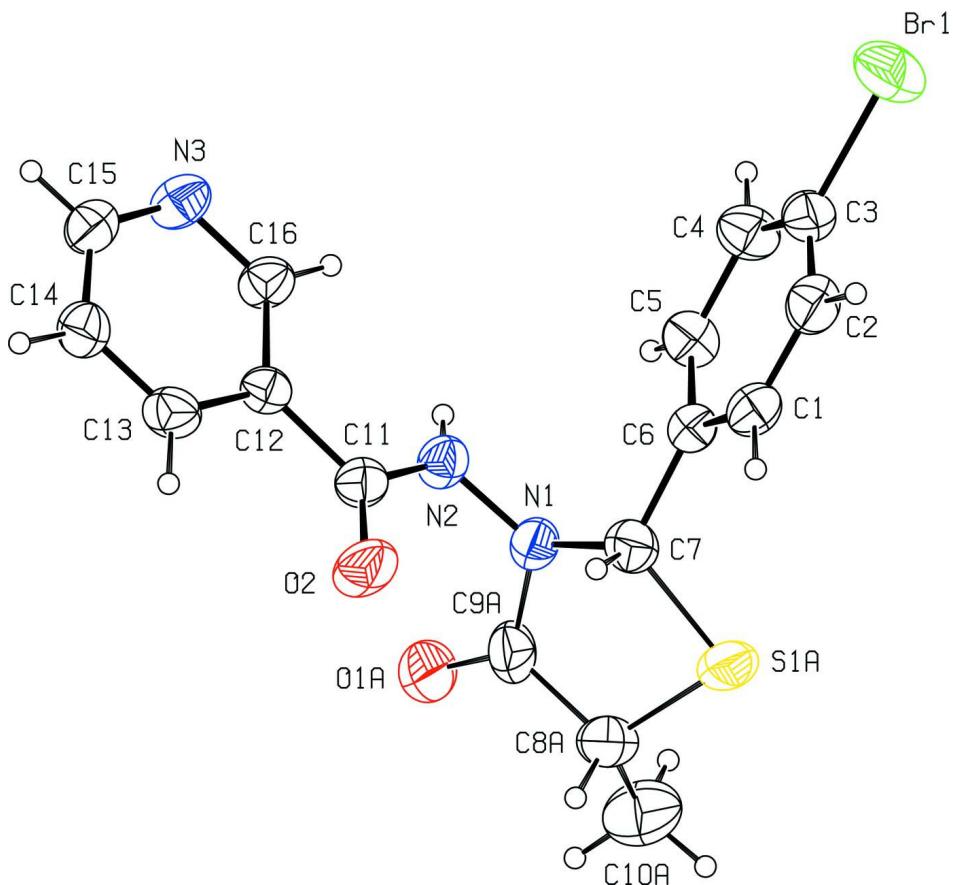

The molecular structure has two weak intramolecular C—H···N interactions (Table 1), generating *S*(5) ring motifs, and the crystal structure is stabilized by intermolecular N—H···N and C—H···O hydrogen bonds (Table 1 and Fig. 2). In addition, a π–π stacking interaction is observed [ $Cg3 \cdots Cg4(1/4 + y, 1/4 - x, 1/4 + z) = 3.758$  (2) Å, where  $Cg3$  and  $Cg4$  are the centroids of the pyridine N3/C12–C16 and benzene C1–C6 rings, respectively].

### S2. Experimental

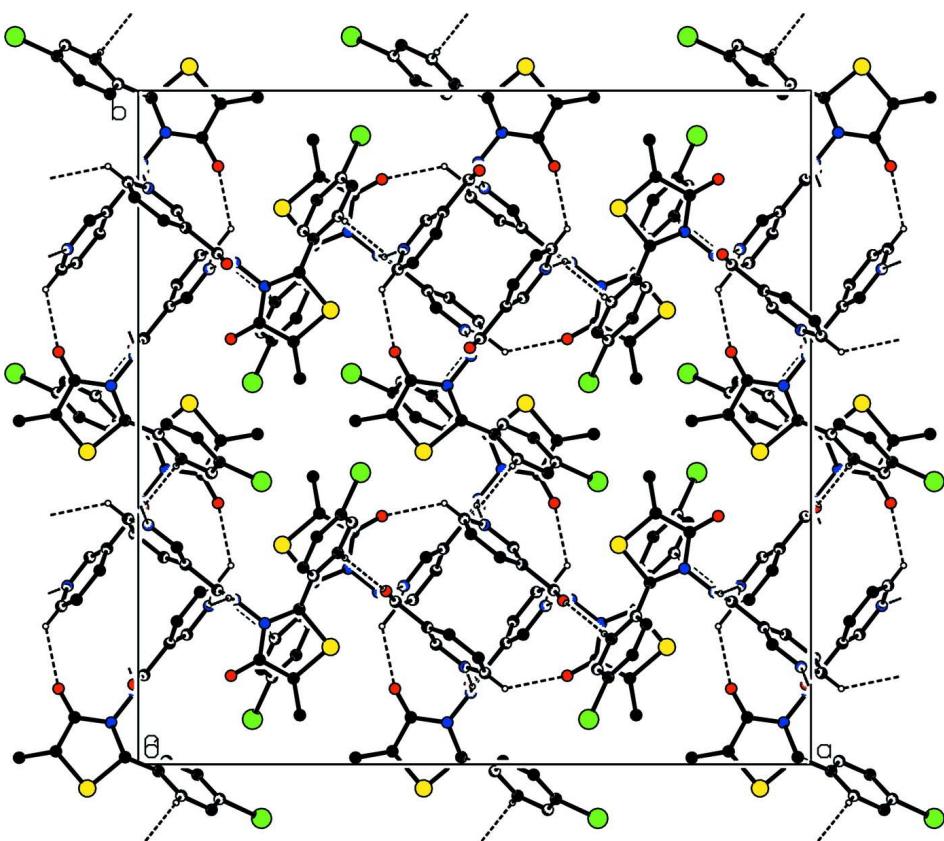

*N*-(4-bromobenzylidene)pyridine-3-carbohydrazide (0.01 mol) was reacted with 0.028 mol of 2-mercaptopropanoic acid in anhydrous benzene for 7 h using a Dean-Stark trap. Excess benzene was removed under reduced pressure. The residue was triturated with saturated sodium bicarbonate solution. The separated solid was filtered, washed with water and crystallized from methanol to yield white crystalline *N*-(5-methyl-2-(4-bromophenyl)-4-oxo-1,3-thiazolidin-3-yl)pyridine-3-carboxamide. **S3. Refinement**

The C-bound H atoms were geometrically placed ( $C-H = 0.93\text{--}0.98 \text{ \AA}$ ) and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2$  or  $1.5U_{\text{eq}}(\text{C})$ . The N-bound H atom was located from the Fourier synthesis and restrained to  $0.86(2) \text{ \AA}$ , and refined with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$ . The 1,3-thiazolidine group, except for the N1 and C7 atoms, is disordered over two sites with site occupancies of 0.605 (13) and 0.395 (13). In the last cycles of the refinement, the following values are used for the distance restraints (DFIX): 1.80 (1)  $\text{\AA}$  for the S—C bond, 1.25 (1)  $\text{\AA}$  for C—O, 1.39 (1)  $\text{\AA}$  for C—N and 1.50 (1)  $\text{\AA}$  for C—C

**Figure 1**

The title molecule with the atom numbering scheme. Displacement ellipsoids for non-H atoms are drawn at the 30% probability level. Only the major component of the disorder is shown.

**Figure 2**

The packing and hydrogen bonding interactions viewed down the *c* axis. All hydrogen atoms not involved in hydrogen bonding and the minor component of the disorder have been omitted for clarity.

*Special details*

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement on  $F^2$  for ALL reflections except those flagged by the user for potential systematic errors. Weighted  $R$ -factors  $wR$  and all goodnesses of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The observed criterion of  $F^2 > \sigma(F^2)$  is used only for calculating - $R$ -factor-obs etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
