## 4-(4-Nitrophenoxy)butanol

Zareen Akhter, ${ }^{\text {a* }}$ Vickie McKee, ${ }^{\text {b }}$ Muhammad Saif Ullah Khan, ${ }^{\text {a }}$ Bushra Iftikhar ${ }^{\text {a }}$ and Humaira M. Siddiqi ${ }^{\text {a }}$<br>${ }^{\text {a }}$ Department of Chemistry, Quaid-i-Azam University, Islamabad 45320, Pakistan, and ${ }^{\mathbf{b}}$ Chemistry Department, Loughborough University, Loughborough LE11 3TU, England<br>Correspondence e-mail: zareenakhter@yahoo.com

Received 26 February 2011; accepted 1 March 2011
Key indicators: single-crystal X-ray study; $T=150 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.045 ; w R$ factor $=0.139 ;$ data-to-parameter ratio $=21.0$.

The crystal structure of the title compound, $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{4}$, features intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ (nitro) hydrogen bonding, which links molecules into supramolecular chains running parallel to the $b c$ diagonal. There is also $\pi-\pi$ stacking between 4-nitrophenyl groups, the interplanar distance between the nitrobenzene rings being 3.472 (2) A.

## S1. Comment

Polymers are an important class of materials which have either supplemented or replaced conventional substances such as wood, stone, metal, glass and ceramics in modern technological applications (Chandrasekhar, 2005). Therefore, considerable research in recent years has focused upon producing novel polymeric materials with a better balance of physical and chemical properties (Shockravi et al., 2007). Various flexible linkages such as the ether moiety (Patil et al., 2010) and methylene spacers (Scholl et al., 2007) can be introduced into the polymer backbone in order to improve their properties. The incorporation of an aryl-ether moiety is believed to impart enhanced solubility and processability to the polymers while maintaining their toughness (Shahram Mehdipour-Ataei \& Zigheimat, 2007). On the other hand, the inclusion of aliphatic methylene spacers in the macrochain increases the degree of freedom by reducing the segmental barrier and effectively disrupts intermolecular interactions (Schab-Balcerzak et al., 2002). Thus, the final polymer prepared from the monomers containing flexible linkages not only exhibits an enhancement in its processability but also shows an improvement in its performance as these flexible linkages also bestow mesogenic (Choi et al., 2004) and optical properties (Liu et al., 2008) to the resulting polymeric materials. The title compound, (I), Fig. 1, is a nitro-alcohol precursor with built-in methylene spacers along with aryl-ether moiety, which was prepared as part of our quest to design and synthesize structurally modified monomers for processable high performance polymers.

The alcohol group is H -bonded to the nitro group of a neighbouring molecule, Table 1. These link molecules into supramolecular chains running along the $b c$ diagonal, Fig. 2 . There are $\pi-\pi$ interactions between the chains; the interplanar distance between the nitrobenzene rings is 3.472 (2) $\AA$ (symmetry operation: $x-1, y, z$ ).

## S2. Experimental

The title compound (I) was synthesized by Williamson's etherification of 1,4-butane diol and p-nitrochlorobenzene. A three-necked round bottom flask equipped with reflux condenser, thermometer and nitrogen inlet was charged with a suspension of 1,4-butane diol ( $1.69 \mathrm{ml} ; 19.1 \mathrm{mmol}$ ) and anhydrous potassium carbonate ( $2.65 \mathrm{~g} ; 19.1 \mathrm{mmol}$ ) in dimethylformamide ( 40 ml ) and stirred for 30 min . The resulting mixture was heated to $383-393 \mathrm{~K}$ for 6 h . The reaction mixture was poured into 500 ml of chilled water, cooled to room temperature and the crude product was filtered as a light-yellow solid mass. The product was then washed thoroughly with water, dissolved in ethanol and set aside for crystallization. Yield 79\%, M.pt. 344 K.

## S3. Refinement

H atoms were placed in calculated positions using a riding model with $\mathrm{C}-\mathrm{H}$ distances constrained to 0.95 and $0.99 \AA$ for aryl and methylene groups, respectively, and with $U_{\mathrm{iso}}(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$. The hydrogen bonded to oxygen was located from difference maps; the coordinates were refined freely with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{O})$.

Figure 1
Perspective view of the molecule, showing ellipsoids at the $50 \%$ probability level. Hydrogen atoms are shown as arbitrary spheres.

Figure 2
Packing diagram viewed down the $a$ axis. Hydrogen atoms have been omitted and the dashed line represent $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds.

$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0693 P)^{2}+0.098 P\right]$
where $P=\left(F_{0}^{2}+2 F_{\mathrm{c}}^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=0.33$ e $\AA^{-3}$
$\Delta \rho_{\text {min }}=-0.24 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors (gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
