## $N, N^{\prime}$-Bis(2-chlorophenylsulfonyl)suberamide

Vinola Z. Rodrigues, ${ }^{\text {a }}$ Sabine Foro ${ }^{\text {b }}$ and B. Thimme Gowda ${ }^{\text {a* }}$

${ }^{\text {a }}$ Department of Chemistry, Mangalore University, Mangalagangotri 574 199, Mangalore, India, and ${ }^{\mathbf{b}}$ Institute of Materials Science, Darmstadt University of Technology, Petersenstrasse 23, D-64287 Darmstadt, Germany
Correspondence e-mail: gowdabt@yahoo.com
Received 8 March 2011; accepted 10 March 2011
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.003 \AA$; $R$ factor $=0.038 ; w R$ factor $=0.104$; data-to-parameter ratio $=15.4$.

In the crystal of the title compound, $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{~S}_{2}$, the asymmetric unit comprises half of a molecule, the remaining portion is generated via an inversion centre. The conformation of the $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds in the $\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})-\mathrm{C}$ segment is anti. The molecule is bent at the S atom with the $\mathrm{C}-$ $\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(\mathrm{O})$ torsion angle being 68.16 (19) ${ }^{\circ}$. The dihedral angle between the plane of the benzene ring and the $\mathrm{SO}_{2}-$ $\mathrm{NH}-\mathrm{C}(\mathrm{O})-\mathrm{C}$ segment is $77.5(1)^{\circ}$. Hydrogen bonds of the type $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}(\mathrm{C})$ link molecules into supramolecular chains along the $b$ axis.

## $\mathrm{N}, \mathrm{N}^{\prime}$-Bis(2-chlorophenyIsulfonyl)suberamide

Vinola Z. Rodrigues, Sabine Foro and B. Thimme Gowda

## S1. Comment

The amide and sulfonamide moieties are important constituents of many biologically significant compounds. As part of an investigation studying the effect of substituents on the structures of this class of compounds (Gowda et al., 2000, 2005; Rodrigues et al., 2011), in the present work, the structure of $N, N$-bis(2-chlorophenylsulfonyl)-suberamide (I) has been determined (Fig. 1). The asymmetric unit comprises half of a molecule, the remaining portion is generated through an inversion centre, similar to that observed in $N, N$-bis(2-chlorophenylsulfonyl)-adipamide (II) (Rodrigues et al., 2011). The conformation of the $\mathrm{N}-\mathrm{H}$ and $\mathrm{C}=\mathrm{O}$ bonds in the $\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(=\mathrm{O})-\mathrm{C}$ segment is anti. The molecule is bent at the S atom with the $\mathrm{C}-\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(=\mathrm{O})$ torsion angle being $68.16(19)^{\circ}$, compared to the value of -65.1 (6) ${ }^{\circ}$ in (II). The torsion angles $\mathrm{C} 2-\mathrm{C} 1-\mathrm{S} 1-\mathrm{N} 1$ and $\mathrm{C} 6-\mathrm{C} 1-\mathrm{S} 1-\mathrm{N} 1$ are, respectively, $70.6(2)^{\circ}$ and $-113.32(17)^{\circ}$. The corresponding values in (II) are $-69.5(6)^{\circ}$ and $108.8(5)^{\circ}$, respectively. The dihedral angle between the planes of the benzene ring and the $\mathrm{SO}_{2}-\mathrm{NH}-\mathrm{C}(=\mathrm{O})-\mathrm{C}$ segment in (I) is $77.5(1)^{\circ}$, compared to the value of 89.6 (2) ${ }^{\circ}$ in (II). A series of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}(\mathrm{C})$ intermolecular hydrogen bonds (Table 1) link the molecules into chains running along the $b$ axis (Fig. 2).

## S2. Experimental

Compound (I) was prepared by refluxing a mixture of suberic acid ( 0.01 mol ) with 2-chlorobenzenesulfonamide ( 0.02 mol ) and $\mathrm{POCl}_{3}$ for 1 h on a water bath. The reaction mixture was allowed to cool and diethyl ether added. The solid product obtained was filtered, washed thoroughly with ether and hot ethanol. The compound was recrystallized to a constant melting point. Colourless prisms were grown by the slow evaporation of its ethanol solution at room temperature.

## S3. Refinement

The H atom of the NH group was located in a difference map and later restrained to the distance $\mathrm{N}-\mathrm{H}=0.86 \pm 0.02 \AA$. The other H atoms were positioned with idealized geometry using a riding model with aromati-C-H distance $=0.93 \AA$, and methylene-C-H $=0.97 \AA$. All H atoms were refined with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{N}, \mathrm{C})$.

Figure 1
Molecular structure of (I), showing the atom labelling scheme and displacement ellipsoids at the $50 \%$ probability level.

Figure 2
Molecular packing of (I) viewed in projection down the $a$ axis and with hydrogen bonding shown as dashed lines.

148 parameters
1 restraint
Primary atom site location: structure-invariant direct methods

## Special details

Experimental. CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.
Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
