Correspondence e-mail: zhangqingfu@foxmail.com

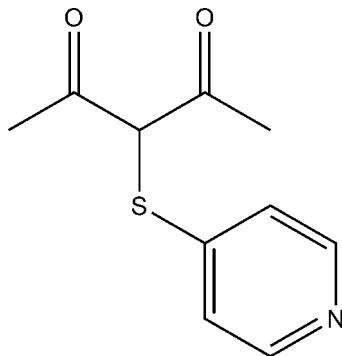

Received 24 March 2011; accepted 27 March 2011

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.038; wR factor = 0.120; data-to-parameter ratio = 14.0.

In the title compound, $\text{C}_{10}\text{H}_{11}\text{NO}_2\text{S}$, the acetylacetone group crystallizes in the keto form with all the non-hydrogen atoms in the acetylacetone group approximately co-planar with a maximum atomic deviation 0.055 (2) \AA ; the dihedral angle between the acetylacetone group and the pyridine ring is 85.90 (6) $^\circ$. An intramolecular O—H \cdots O hydrogen bond involving the acetylacetone group forms a six-membered ring.

3-(Pyridin-4-ylthio)pentane-2,4-dione

Qing-Fu Zhang, Jian-Dong Pang, De-Zhi Sun and Cai-Hua Liu

S1. Comment

The β -diketones and their derivatives have attracted much attention in recent years, not only for their valuable intrinsic chemical and physical properties but also for their wide applications in metallo-supramolecular chemistry (Aromí & Gamez *et al.*, 2008; Massue & Bellec *et al.*, 2005; Soldatov & Ripmeester, 2001; Tabellion & Seidel *et al.*, 2001; Vigato & Peruzzo *et al.*, 2009; Chen & Fronczek *et al.*, 2003; Chen & Fronczek *et al.*, 2004; Domasevitch & Vreshch, *et al.*, 2006; Vreshch & Chernega *et al.*, 2003; Vreshch & Lysenko *et al.*, 2004; Won & Clegg *et al.*, 2007; Zhang & Chen *et al.*, 2006). Among them, the N-containing bifunctional derivatives of β -diketones have been successfully applied to construct various metal-organic supramolecular complexes (Chen & Fronczek *et al.*, 2003; Chen & Fronczek *et al.*, 2004; Domasevitch & Vreshch, *et al.*, 2006; Vreshch & Chernega *et al.*, 2003; Vreshch & Lysenko *et al.*, 2004; Won & Clegg *et al.*, 2007; Zhang & Chen *et al.*, 2006). We report here on the structure of an interesting nonlinear N-containing bifunctional compound, 3-(pyridin-4-ylthio)pentane-2,4-dione, which is prepared according to the previously reported method (Won & Clegg *et al.*, 2007).

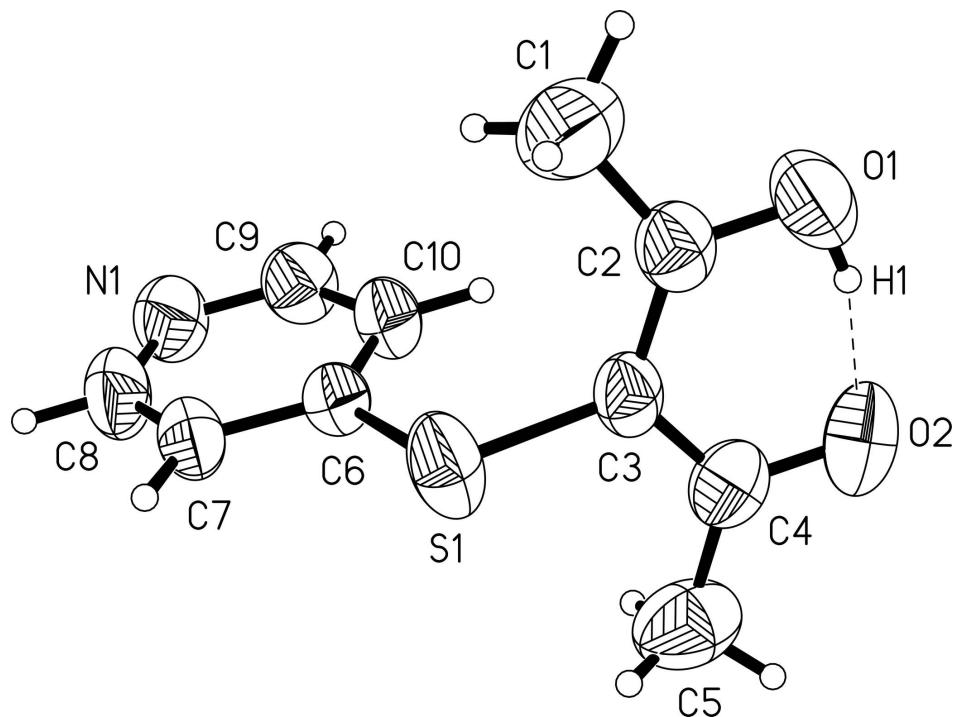

As shown in Fig. 1, the acetylacetone group is with keto-enol tautomerism, where all the non-hydrogen atoms in the acetylacetone group are approximately co-planar with a maximum atomic deviation 0.0547 (24) Å, and the dihedral angle between the acetylacetone group and the pyridine ring is about of 85.90 (6) $^{\circ}$. The bond angle of C3—S1—C6 is about of 105.16 (10) $^{\circ}$, leading to a V-shaped conformation of the whole molecule. In the crystal strucutre, the intramolecular O—H \cdots O hydrogen bonding interactions have been found in the same acetylacetone group, forming a six-membered cyclic structure. However, no intermolecular H-bonding interactions have been found in the title comound (Fig. 2).

S2. Experimental

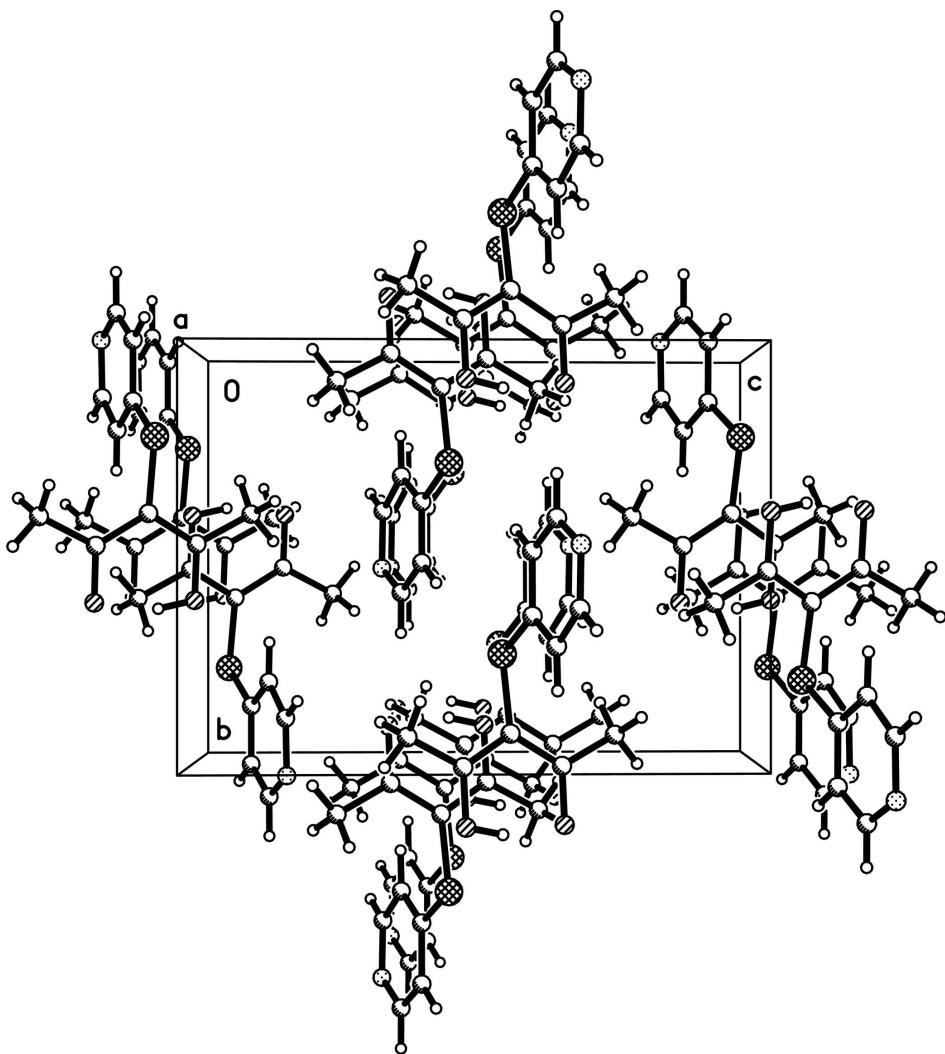

The title compound, 3-(pyridin-4-ylthio)pentane-2,4-dione, was prepared according to the previously reported method (Won & Clegg *et al.*, 2007). The yellow crystals of title compound suitable for X-ray crystallographic analysis were obtained by recrystallization from acetonitrile.

S3. Refinement

All H atoms on C atoms were positioned geometrically and refined as riding atoms with d(C—H)=0.93–0.97 Å, and $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$. The H atom on O atom of enol group was located from difference Fourier map and refined with d(O—H)=0.881 Å, and $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{O})$.

**Figure 1**

Extinction coefficient: 0.136 (9)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
