Received 5 April 2011; accepted 19 April 2011

Key indicators: single-crystal X-ray study;  $T = 200\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.029;  $wR$  factor = 0.072; data-to-parameter ratio = 20.5.

The title compound,  $\text{C}_8\text{H}_7\text{BrO}$ , is a halogenated derivative of acetophenone. The molecule shows noncrystallographic  $C_s$  symmetry. The intracyclic  $\text{C}-\text{C}-\text{C}$  angles cover the range  $118.8(2)$ – $120.4(3)^\circ$ . In the crystal structure,  $\text{C}-\text{H}\cdots\text{O}$  contacts connect the molecules into undulating sheets perpendicular to the crystallographic  $c$  axis.

## 2-Bromo-1-phenylethanone

**Richard Betz, Cedric McCleland and Harold Marchand**

### S1. Comment

Derivatives of acetophenone are widely used in preparative organic chemistry. At the beginning of a comprehensive study about the effects of various substituents on benzo-annulated seven-membered ring systems, the molecular structure of the title compound was determined to enable comparisons with acetophenone-derived target compounds.

Intracyclic C—C—C angles span a range from 118–120°. The smallest angle is found on the C atom bearing the carbonylic substituent while the second smallest one is found on the C atom in *para*-position. The atoms of the aliphatic substituent are nearly coplanar with the aromatic system and its conjugated carbonyl group, the least-squares planes defined by their respective atoms intersect at an angle of only 4.18 (15)°.

In the crystal structure, C—H···O contacts can be observed which stem from both H atoms of the methylene group as well as one of the H atoms in *ortho*-position to the substituent on the phenyl ring. The carbonylic O atom serves as threefold acceptor (Fig. 2). Describing these contacts in terms of graph-set analysis necessitates a  $C(4)C(4)C(5)$  descriptor on the unitary level. In total, the molecules are connected to waved sheets perpendicular to the crystallographic *c* axis. The shortest distance between the centroids of two  $\pi$ -systems was measured at 5.8289 (17) Å.

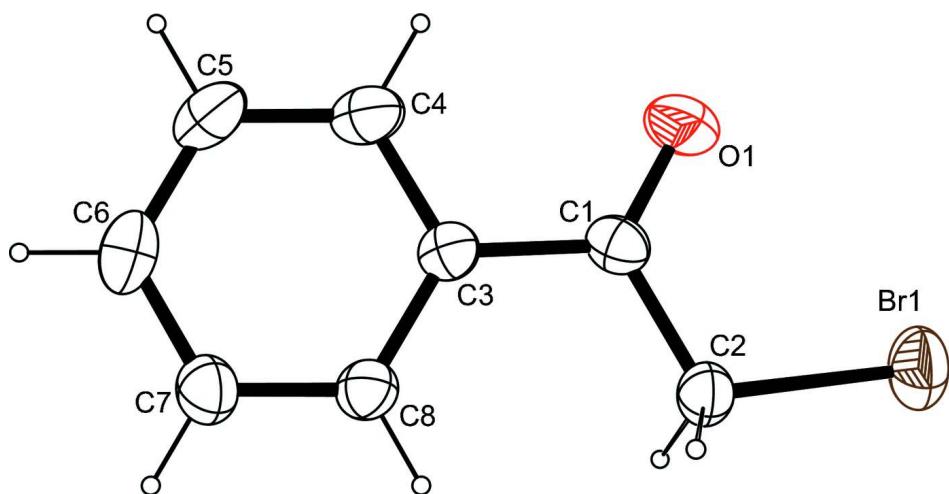

The packing of the compound in the crystal is shown in Fig. 3.

### S2. Experimental

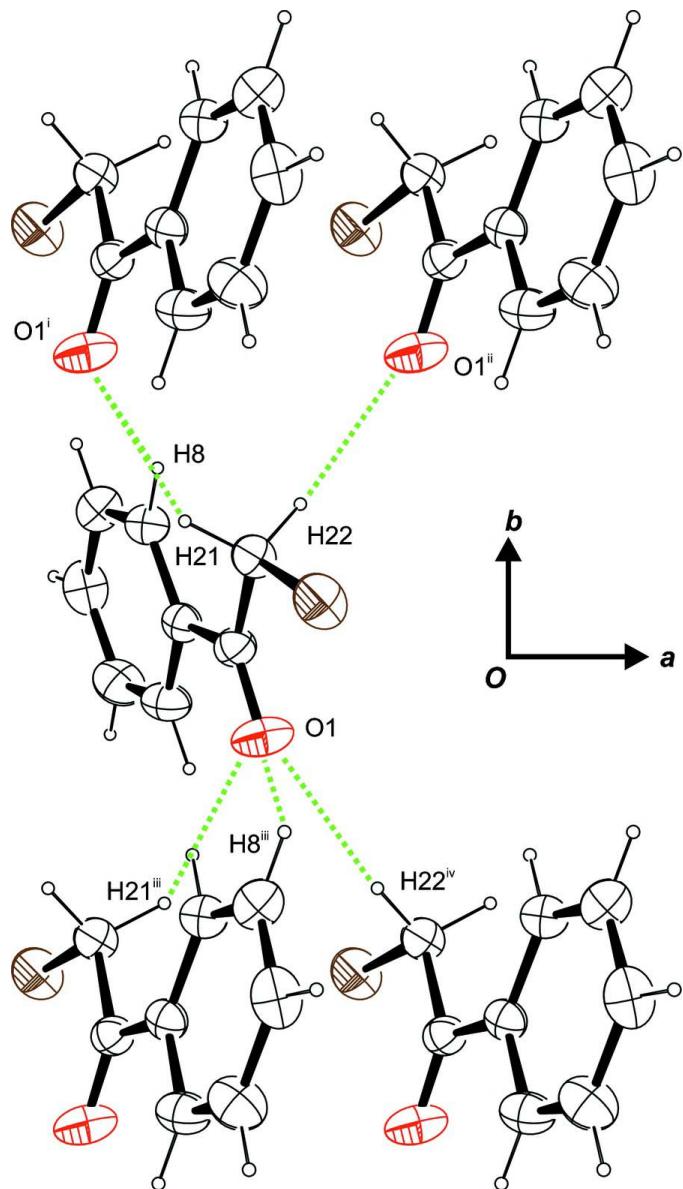

The compound was obtained commercially (Schuchardt). Crystals suitable for the X-ray diffraction study were taken directly from the provided batch.

### S3. Refinement

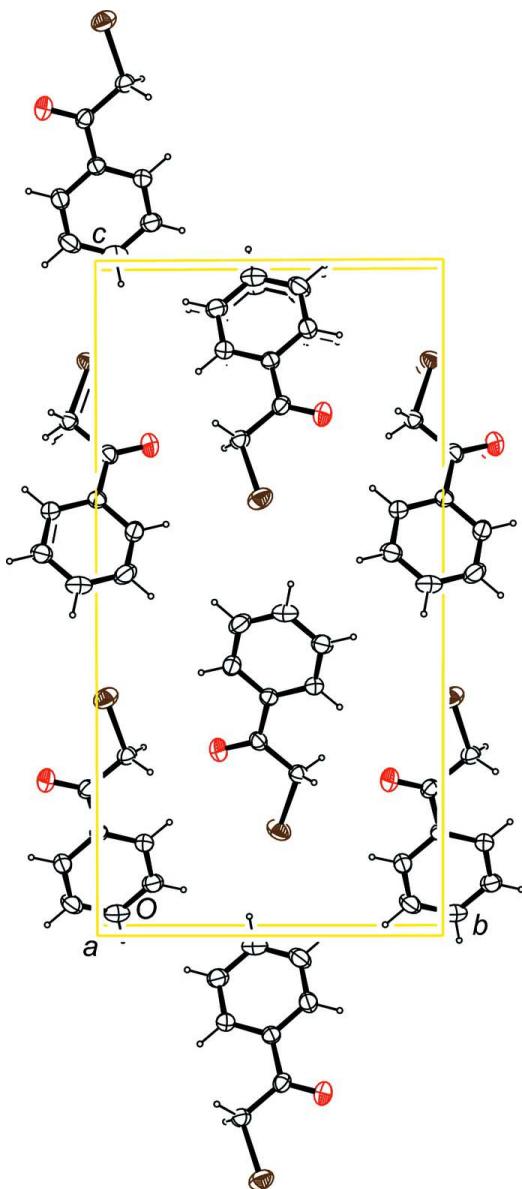

Carbon-bound H atoms were placed in calculated positions (C—H 0.99 Å for the methylene group and C—H 0.95 Å for aromatic C atoms) and were included in the refinement in the riding model approximation, with  $U(H)$  set to  $1.2U_{eq}(C)$ .
