Received 30 March 2011; accepted 1 April 2011

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.041;  $wR$  factor = 0.105; data-to-parameter ratio = 19.9.

In the title compound,  $C_{20}H_{15}N_3O_3S$ , the thiazole ring is approximately planar, with a maximum deviation of 0.003 (1)  $\text{\AA}$ , and makes dihedral angles of 7.44 (6) and 1.88 (6) $^\circ$  with the hydroxy-substituted phenyl ring and the pyran ring, respectively. The hydroxyl group is disordered over two sets of sites, with an occupancy ratio of 0.567 (3):0.433 (3). In the crystal, the major disorder component molecules are connected via bifurcated (three-centre)  $O-\text{H}\cdots O$  and  $C-\text{H}\cdots O$  hydrogen bonds, generating  $R_2^1(6)$  motifs and resulting in supramolecular chains along the  $a$  axis. In the minor occupancy component, however, molecules are connected via  $C-\text{H}\cdots O$  hydrogen bonds, forming supramolecular chains along the  $b$  axis. Furthermore, the crystal structure is stabilized by  $\pi-\pi$  interactions between the thiazole rings [centroid–centroid distance = 3.5476 (7)  $\text{\AA}$ ].

### S1. Comment

Coumarin derivatives containing the thiazolyl unit exhibit promising antimicrobial activities against different microbial strains (Raghu *et al.*, 2009), including *Mycobacterium tuberculosis* (Gursoy *et al.*, 2003) and *Helicobacter pylori* (Chimenti *et al.*, 2010). These types of compounds are also reported to be good anticancer (Kamal *et al.*, 2009), analgesic and anti-inflammatory agents (Kalkhambkar *et al.*, 2007). The title compound is a new derivative of coumarin with the thiazole ring. We present here its crystal structure.

In the molecular structure of the compound, (Fig. 1), the thiazole (S1/N1/C10–C12) ring is approximately planar, with a maximum deviation of 0.003 (1) Å for atom C11. The central thiazole (S1/N1/C10–C12) ring makes dihedral angles of 7.44 (6)° and 1.88 (6)° with the hydroxyl- substituted phenyl (C14–C19) ring and the pyran (O1/C1,C2/C7–C9) ring, respectively. The hydroxyl group is disordered over two sites, with an occupancy ratio 0.567 (3):0.433 (3).

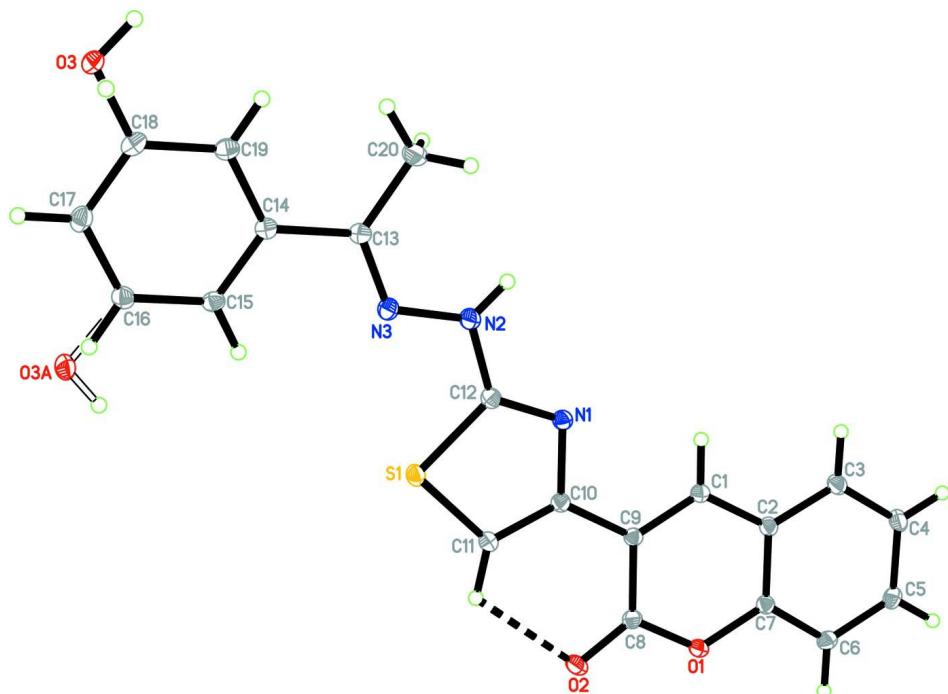

In the crystal packing (Fig. 2), the major component molecules are connected via bifurcated O3—H1OA···O2 and C19—H19A···O2 hydrogen bonds, generating  $R^1_{12}(6)$  motifs, (Bernstein *et al.*, 1995), resulting in supramolecular chains along the *a*-axis. In the minor component, however, molecules are connected via C19—H19A···O2 hydrogen bonds, forming one-dimensional supramolecular chains along the *b*-axis (Fig. 3). Furthermore, the crystal structure is stabilized by  $\pi\cdots\pi$  interactions between the thiazole (S1/N1/C10–C12) rings [centroid-centroid distance = 3.5476 (7) Å; -*x*, -*y*, 1–*z*].

### S2. Experimental

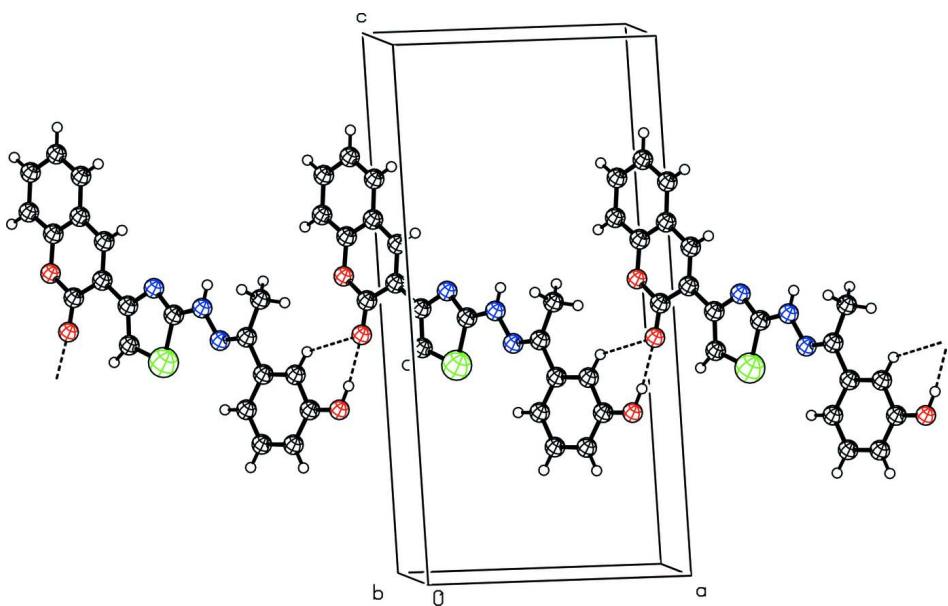

(E)-2-(1-(3-Hydroxyphenyl)ethylidene)hydrazinecarbothioamide (Greenbaum *et al.*, 2004) and 3-[ $\omega$ -bromoacetyl coumarin] (Nadeem *et al.*, 2009) were synthesized as reported in the literature. The title compound was prepared by treating (E)-2-(1-(3-hydroxyphenyl)ethylidene)hydrazinecarbothioamide (2.5 mmol) with 3- $\omega$ -bromoacetylcoumarin (2.5 mmol) in a chloroform-ethanol (2:1) mixture. The reaction mixture was refluxed for 2–3 hours at 60°C to yield dense yellow precipitates. The precipitates were filtered and boiled with water containing sodium acetate. The title compound was recrystallized as golden crystals from ethanol:chloroform (3:1).

### S3. Refinement

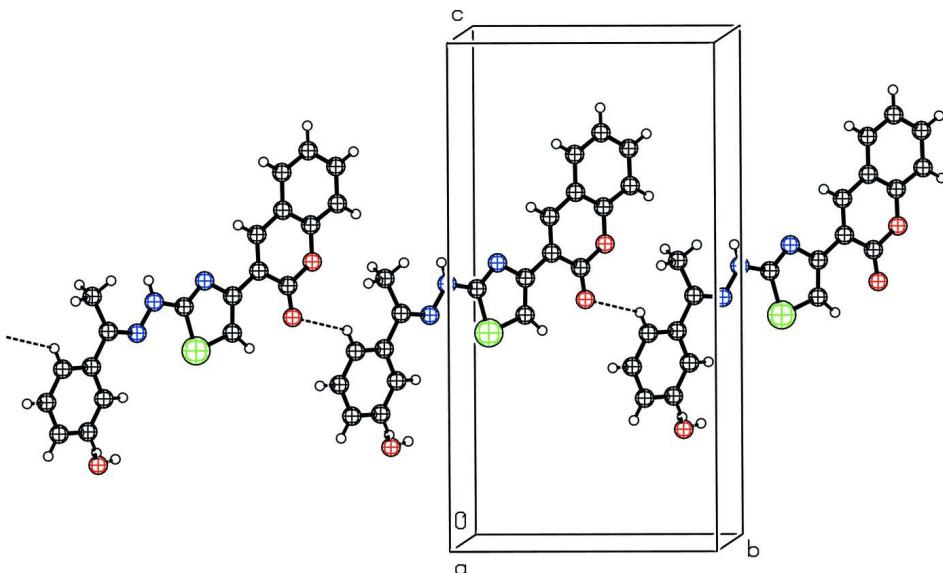

Atoms H1N2, H1OA, H1OB and H11 were located in a difference Fourier map and refined freely [N—H = 0.85 (2) Å; O—H = 0.80 (5) and 0.89 (4) Å; C—H = 0.965 (17) Å]. The remaining H atoms were positioned geometrically [C—H = 0.93 Å for aromatic C and C—H = 0.96 Å for methyl C] and were refined using a riding model, with  $U_{\text{iso}}(\text{H}) = kU_{\text{eq}}(\text{C})$ , where  $k = 1.2$  for aromatic C and 1.5 for methyl C. A rotating group model was applied to the methyl groups. The hydroxyl group is disordered over two sites, with an occupancy ratio 0.567 (3):0.433 (3).

### Special details

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
