Key indicators: single-crystal X-ray study;  $T = 198$  K; mean  $\sigma(\text{C}-\text{C}) = 0.010$  Å;  
R factor = 0.040; wR factor = 0.097; data-to-parameter ratio = 15.3.

The title compound,  $[\text{Pb}(\text{C}_6\text{F}_5\text{S})_2(\text{C}_5\text{H}_5\text{N})_2]_n$ , shows the  $\text{Pb}^{II}$  atom in a  $\psi$ -trigonal bipyramidal  $\text{S}_2\text{N}_2$  bonding environment. Pyridine N atoms occupy axial sites, while thiolate S atoms and a stereochemically active lone pair occupy equatorial sites. Very long intermolecular  $\text{Pb}\cdots\text{S}$  interactions [3.618 (4) and 3.614 (4) Å] yield a weakly associated one-dimensional polymeric structure extending parallel to [010].

### Related literature

Lead(II) thiolates tend to form polymeric structures in the solid state *via* intermolecular  $\text{Pb}\cdots\text{S}$  interactions, see: Davidovich *et al.* (2010) and references therein; Eichhöfer (2005). However, the bonding environment at lead and the degree of intermolecular bonding may be altered *via* the introduction of Lewis base ligands that occupy metal coordination sites, see: Appleton *et al.* (2004); Briand *et al.* (2007). It has been shown that  $[(\text{F}_5\text{C}_6\text{S})_2\text{Pb}]_n$  exhibits a three-dimensional framework structure containing hexacoordinated  $\text{Pb}^{II}$  atoms (Fleischer *et al.*, 2006). For van der Waals radii, see: Bondi (1964); Brown (1978).

### **S1. Comment**

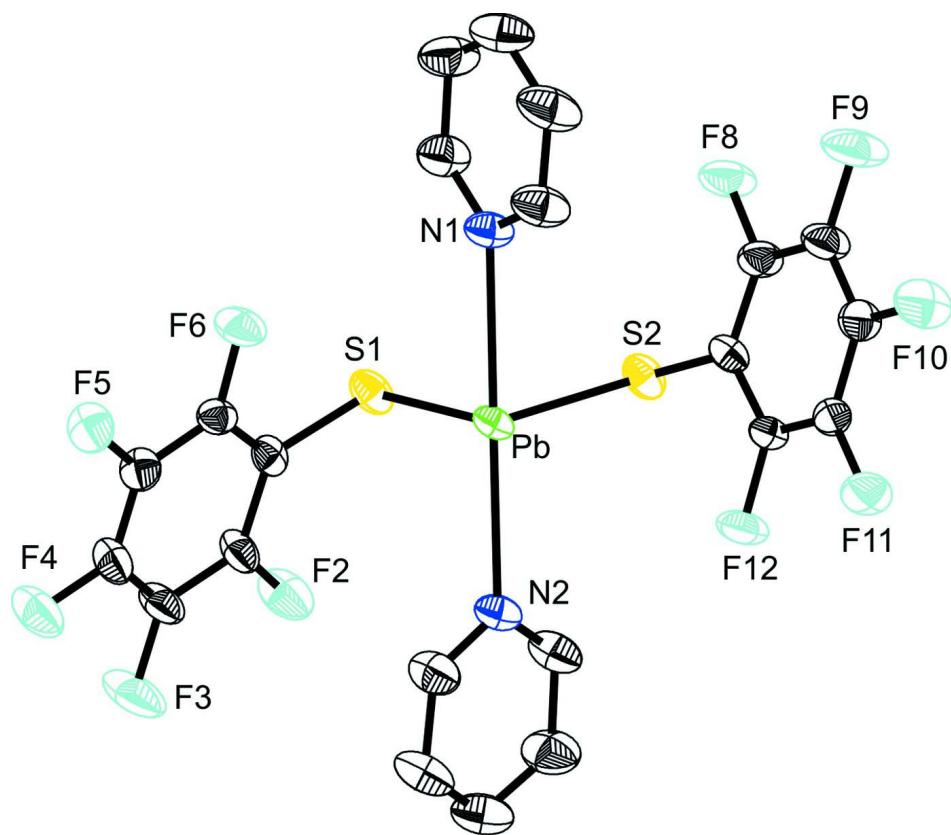

Lead(II) thiolates tend to form polymeric structures in the solid state *via* intermolecular Pb  $\cdots$  S interactions (Davidovich *et al.*, 2010, and references therein; Eichhöfer, 2005). However, the bonding environment at lead and the degree of intermolecular bonding may be altered *via* the introduction of Lewis base ligands that occupy metal coordination sites (Appleton *et al.*, 2004; Briand *et al.*, 2007). It has been shown that  $[(\text{F}_5\text{C}_6\text{S})_2\text{Pb}]_n$  exhibits a three-dimensional layered structure containing hexacoordinated Pb<sup>II</sup> atoms (Fleischer *et al.*, 2006). The corresponding bis-pyridine adduct (I) (Fig. 1) shows Pb1 in a  $\psi$ -trigonal bipyramidal bonding environment, with two pyridine nitrogen atoms in *trans* axial sites [N1—Pb—N2 = 177.29 (17) $^\circ$ ] and two sulfur atoms in *cis* equatorial sites [S1—Pb—S2 = 87.13 (6) $^\circ$ ]. The remaining "open" equatorial site is presumably occupied by the stereochemically active lone pair of Pb<sup>II</sup>. This is a similar bonding motif to that observed for  $(2,6\text{-Me}_2\text{C}_6\text{H}_3\text{S})_2\text{Pb} \times 2\text{py}$  (Appleton *et al.*, 2004), but shows some subtle structural differences. The Pb—N bond distances in (I) [Pb—N1 = 2.643 (7), Pb—N2 = 2.637 (7) Å] are significantly shorter than those in  $(2,6\text{-Me}_2\text{C}_6\text{H}_3\text{S})_2\text{Pb} \times 2\text{py}$  [2.689 (3) and 2.695 (3) Å], while the Pb—S distances [Pb—S1 = 2.650 (2), Pb—S2 = 2.653 (2) Å] are significantly longer [2.6078 (9) and 2.6079 (9) Å for  $(2,6\text{-Me}_2\text{C}_6\text{H}_3\text{S})_2\text{Pb} \times 2\text{py}$ ]. This may be rationalized by considering the increased electron withdrawing ability of the C<sub>6</sub>F<sub>5</sub> group in (I) *versus* the 2,6-Me<sub>2</sub>C<sub>6</sub>H<sub>5</sub> group in  $(2,6\text{-Me}_2\text{C}_6\text{H}_3\text{S})_2\text{Pb} \times 2\text{py}$ . The result is an effective increase in the Lewis acidity at the Pb centre, and shorter Pb—N Lewis acid-base bonding interactions. Very weak intermolecular Pb  $\cdots$  S interactions [Pb—S1<sup>i</sup> = 3.618 (4), Pb—S2<sup>i</sup> = 3.614 (4) Å; (i) -1 + *x*, *y*, *z*; sum of van der Waals' radii = 3.8 Å] (Bondi, 1964; Brown, 1978) between adjacent molecules in (I) yield a one-dimensional polymeric structure (Fig. 2). These contacts are nearly *trans* to the short Pb—S bonds [S1—Pb—S2<sup>i</sup> = 166.75 (5) $^\circ$ , S2—Pb—S1<sup>i</sup> = 166.83 (5) $^\circ$ ], yielding a distorted octahedral bonding arrangement at Pb. This weakly associated polymeric structure differs from that of  $(2,6\text{-Me}_2\text{C}_6\text{H}_3\text{S})_2\text{Pb} \times 2\text{py}$ , which is monomeric in the solid-state. Further, the structure possesses no intramolecular Pb  $\cdots$  F contacts such as those observed in  $[(\text{F}_5\text{C}_6\text{S})_2\text{Pb}]_n$  (Fleischer *et al.*, 2006).

### **S2. Experimental**

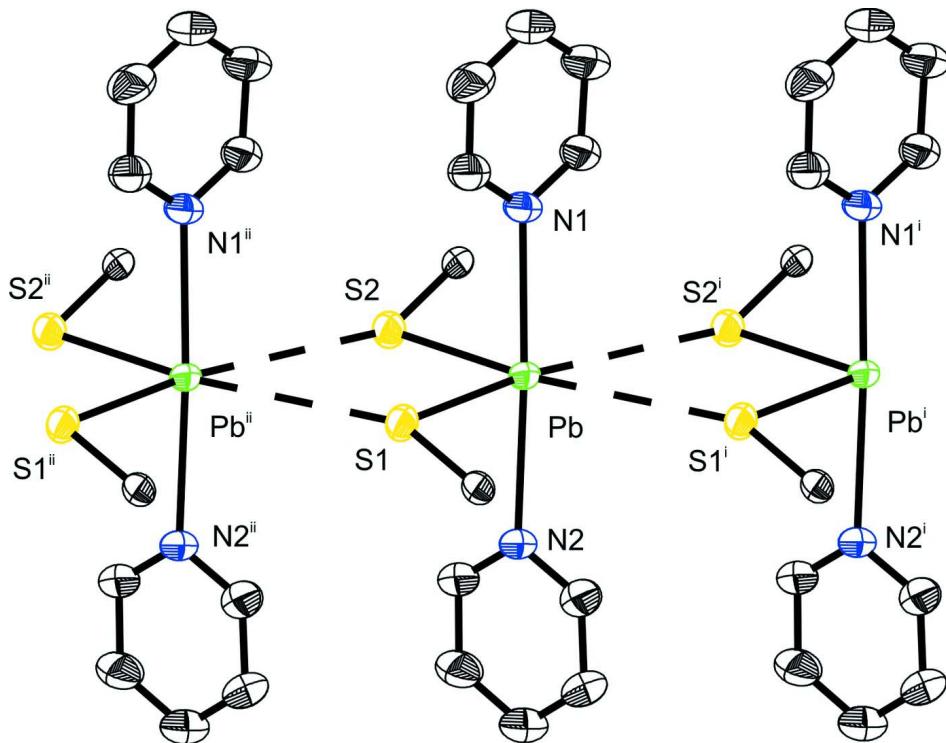

**Synthesis of  $(\text{C}_6\text{F}_5\text{S})_2\text{Pb} \times 2\text{py}$ :** A solution of pyridine (0.520 g, 6.57 mmol) in THF (3 ml) was added dropwise to a stirred solution of  $(\text{C}_6\text{F}_5\text{S})_2\text{Pb}$  (0.100 g, 0.165 mmol) in THF (5 ml) to give a cloudy pale green solution. The solution was stirred for 15 minutes and filtered. After 1 d at 25°C, colorless rod-like crystals of (I) were collected by suction filtration (0.100 g, 0.131 mmol, 79%). Anal. Calc. for  $\text{C}_{21}\text{H}_{10}\text{F}_{10}\text{N}_2\text{PbS}_2$ : C, 34.60; H, 1.32; N, 3.67. Found: C, 34.47; H, 1.05; N, 3.64. Mp 262°C. See expt further details section for spectroscopic data.

### **S3. Refinement**

Hydrogen atoms were placed in calculated positions with C—H distances fixed at 0.93 Å and  $U_{\text{iso}}$  values = 1.2  $U_{\text{eq}}$  of the carrier C atom.

**Figure 1**

X-ray crystal structure of (I), with displacement ellipsoids drawn at the 50% probability level. H atoms have been omitted for clarity. Selected bond distances ( $\text{\AA}$ ) and angles ( $^\circ$ ): Pb—S(1) 2.650 (2), Pb—S(2) 2.653 (2), Pb—N(1) 2.643 (7), Pb—N(2) 2.637 (7), S(1)—Pb—S(2) 87.13 (6), S(1)—Pb—N(1) 91.44 (16), S(1)—Pb—N(2) 86.47 (15), S(2)—Pb—N(1) 86.69 (16), S(2)—Pb—N(2) 91.48 (16), N(1)—Pb—N(2) 177.29 (17).

**Figure 2**

X-ray crystal structure of (I) showing the polymeric structure, with displacement ellipsoids drawn at the 50% probability level. All hydrogen atoms and  $C_6F_5$  group carbon atoms (except  $\alpha$ -carbon) have been omitted for clarity. Symmetry transformations used to generate equivalent atoms: (i)  $-1 + x, y, z$ ; (ii)  $+1 + x, y, z$ .

NMR data (thf- $d_8$ , p.p.m.):  $^1\text{H}$  NMR,  $\delta = 7.36$  (m, 4H, NC<sub>5</sub>H<sub>5</sub>), 7.77 (tt, 2H,  $^3J(^1\text{H}, ^1\text{H}) = 8$  Hz,  $^4J(^1\text{H}, ^1\text{H}) = 2$  Hz, NC<sub>5</sub>H<sub>5</sub>), 8.67 (m, 4H, NC<sub>5</sub>H<sub>5</sub>);  $^{13}\text{C}\{^1\text{H}\}$  NMR,  $\delta = 115.8$  (tm,  $^2J(^{13}\text{C}-^{19}\text{F}) = 22$  Hz, SC<sub>6</sub>F<sub>5</sub>), 124.2 (s, NC<sub>5</sub>H<sub>5</sub>), 136.7 (s, NC<sub>5</sub>H<sub>5</sub>), 137.1 (dm,  $^1J(^{13}\text{C}-^{19}\text{F}) = 245$  Hz, SC<sub>6</sub>F<sub>5</sub>), 137.7 (dm,  $^1J(^{13}\text{C}-^{19}\text{F}) = 247$  Hz, SC<sub>6</sub>F<sub>5</sub>), 148.4 (dm,  $^1J(^{13}\text{C}-^{19}\text{F}) = 226$  Hz, SC<sub>6</sub>F<sub>5</sub>), 149.4 (s, NC<sub>5</sub>H<sub>5</sub>);  $^{19}\text{F}$  NMR,  $\delta = -166.2$  (m, SC<sub>6</sub>F<sub>5</sub>), -164.5 (m, SC<sub>6</sub>F<sub>5</sub>), -133.9 (m, SC<sub>6</sub>F<sub>5</sub>).

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
