Received 6 April 2011; accepted 26 April 2011
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.009 \AA$; $R$ factor $=0.037 ; w R$ factor $=0.114 ;$ data-to-parameter ratio $=27.8$.

In the title compound, $\left[\mathrm{PtI}_{2}\left(\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NO}\right)_{2}\right] \cdot 2\left(\mathrm{CH}_{3}\right)_{2} \mathrm{SO}$, the $\mathrm{Pt}^{\mathrm{II}}$ ion lies on an inversion center and is coordinated in a slightly distorted square-planar environment by two trans iodide ligands and two pyridine N atoms. In the crystal, complex molecules and solvent dimethyl sulfoxide molecules are linked by intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds.

## S1. Comment

Currently, attention is focused on platinum compounds that can bind to DNA differently than cisplatin with the idea that the different nature of binding with DNA may result into an altered spectrum of activity (Daghriri et al., 2004). One such class of compounds are trans- planaramineplatinum complexes that bind with DNA to form mainly interstrand bifunctional $1,2-\mathrm{Pt}(\mathrm{GG})$ adduct whereas cisplatin and its analogues form mainly intrastrand $1,2-\mathrm{Pt}(\mathrm{GG})$ and $1,2-\mathrm{Pt}(\mathrm{AG})$ adducts (Huq et al., 2004). A number of trans-planaramineplatinum complexes have been prepared (Huq et al., 2004; Chowdhury et al., 2005; Beusichem \& Farrell, 1992; Bierbach et al., 1999; Farrell et al., 1992). They have shown in vitro activity similar to cisplatin against various cancer cell lines. One of these compounds is trans-dichloro-bis(3-hydroxypyridine) platinum(II) (Huq et al., 2004). In the title compound the chloride ligands have been replaced by iodide ligands. The crystal structure contains discrete molecules in which $\mathrm{Pt}^{\mathrm{II}}$ ions lie on inversion centers (Fig. 1). $\mathrm{Pt}^{\mathrm{II}}$ ions are coordinated to two symmetry related 3-hydroxypyridine ligand molecules via the pyridine N atoms and by two iodide ligands in a trans mode. The 3-hydroxypyridine ligand is planar with an r.m.s. of 0.0060 (2) $\AA$. The coordination plane $\mathrm{Pt} / \mathrm{N} 1 / \mathrm{I} 1 / \mathrm{N} 1^{\mathrm{i}} / 1^{1}{ }^{\mathrm{i}}$ (Symmetry code: (i) $-\mathrm{x}+1,-\mathrm{y}+1,-\mathrm{z}+1$ ) forms an angle of $72.8(2)^{\circ}$ with the ligand plane (N1/C2-C6/O1). In the crystal, complex molecules and solvent dimethyl sulfoxide molecules are linked by intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Fig. 2).

## S2. Experimental

$1.0 \mathrm{mmol}(415 \mathrm{mg})$ of $\mathrm{K}_{2} \mathrm{PtCl}_{4}$ was dissolved in 10 ml of ml water and $12 \mathrm{mmol}(2.0 \mathrm{~g})$ of KI was added and stirred for $30 \mathrm{~min} .2 .0 \mathrm{mmol}(192 \mathrm{mg})$ of 3-hydroxypyridine, dissolved in 5 ml of ml water by sonification, was added with stirring to the mixture that was kept in ice. The mixture was stirred at room temperature for about 24 h . The yellow precipitate of $\operatorname{Pt}(3 \text {-hydroxypyridine) })_{2} \mathrm{I}_{2}$ was collected by filtration, washed with ice cold water and ethanol, then air-dried. The precipitate was dissolved in a 1:1 DMSO:water mixture on heating and left standing. Crystals were obtained after 15 days.

## S3. Refinement

The hydroxy group was included in the refinemnt with $\mathrm{O}-\mathrm{H}=0.82 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{O}) . \mathrm{H}$ atoms bonded to C atoms were placed in calculated positions with $\mathrm{C}-\mathrm{H}=0.93$ and $0.96 \AA$ and treated as riding on the parent atoms with $U_{\text {iso }}(\mathrm{H})=$ $1.2 U_{\text {eq }}(\mathrm{C})$ or $U_{\text {iso }}(H)=1.5 U_{\text {eq }}\left(\mathrm{C}_{\text {methyl }}\right)$.

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
