Received 20 May 2011; accepted 14 June 2011

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.054; wR factor = 0.127; data-to-parameter ratio = 20.8.

The asymmetric unit of the title xanthene compound, $C_{25}H_{30}O_5$, contains two molecules in which the pyran ring and the dimethoxyphenyl ring are nearly perpendicular to one another [dihedral angles = 86.81 (8) and 84.45 (9) $^\circ$]. One of the methoxy groups in one molecule is twisted away from the phenyl ring [$\text{C}-\text{O}-\text{C}-\text{C}$ torsion angle = -103.40 (16) $^\circ$]. The pyran ring adopts a boat conformation whereas the two fused cyclohexane rings adopt envelope conformations in both molecules. In the crystal, molecules are linked into a three-dimensional network by $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds.

S1. Comment

Synthesis of xanthene derivatives is currently of great interest and has attracted considerable attention by chemists because of their biological and pharmaceutical properties as antiviral (Lambert *et al.*, 1997), antibacterial (Hideo, 1981), and anti-inflammatory (Poupelin *et al.*, 1978). Xanthenes derivatives also find use as dyes, fluorescent material for visualization of biomolecules and in laser technologies (Menchen *et al.*, 2003; Banerjee & Mukherjee, 1981). Several natural occurring polycyclic compounds containing xanthene nucleus are also reported (Ravindranath & Seshadri, 1973). Synthesis of xanthene and 1,8-dioxooctahydroxanthene derivatives have been reported in literature under the different reaction conditions with or without the use of catalyst (Fan *et al.*, 2005; Jin *et al.*, 2005; Srihari *et al.*, 2008). Here we are reporting the synthesis of title compound, (I). The structure of the title compound was established on the basis of its IR, ¹H NMR, ¹³C NMR spectra and finally confirmed by X-ray analysis.

The asymmetric unit of (I) consists of two crystallographically independent molecules, *A* and *B* (Fig. 1). The geometric parameters and the conformations are very similar to the previously reported structure (Mehdi *et al.*, 2011). However, only the dimethoxyphenyl of molecule *B* is different from others. The dimethoxyphenyl grouping in molecule *A* is almost planar [C20A–O4A–C17A–C18A = -1.9 (2) $^{\circ}$ and C21A–O5A–C16A–C17A = 4.6 (2) $^{\circ}$] whereas for molecule *B* is not planar [C20B–O4B–C17B–C18B = -6.1 (2) $^{\circ}$ and C21B–O5B–C16B–C15B = -103.40 (16) $^{\circ}$]. Similarly, the mean plane of pyran ring and the dimethoxyphenyl ring for both *A* and *B* molecules are nearly perpendicular to one another with the dihedral angles between them being 86.81 (8) and 84.45 (9) $^{\circ}$, respectively. For both molecules, the two cyclohexane rings adopt envelope conformations whereas the pyran ring adopts a boat conformation (Cremer & Pople, 1975).

In the crystal, the molecules are linked into a three-dimensional network (Fig. 2) by C—H \cdots O hydrogen bonds (Table 1).

S2. Experimental

A mixture of dimedone (1.40 g m, 10 mmol) and veratraldehyde (1.66 g m, 10 mmol) was heated in 25 ml of glacial acetic acid for three hours. Completion of the reaction was monitored by TLC. The reaction mixture was dried on rotary evaporator under reduced pressure. The crude mixture thus obtained was successively treated with di ethyl ether chloroform and ethanol. The ethanol fraction on crystallization furnished yellow blocks of (I) (m.p. 208 °C, Yield 90%). IR (KBr) ν_{max} : 3085, 3005, 2956, 2929, 2870, 2822, 1667, 1624, 1515, 1467, 1419, 1358, 1227, 1141, 1105, 1023, 851, 830, 751 cm $^{-1}$. ¹H NMR (300 MHz, DMSO-d₆): δ 6.75–6.92 (3*H*, m, Aromatic protons), 4.72 (1*H*, s), 3.83 (3*H*, s), 3.78 (3*H*, s), 2.40 (4*H*, s), 2.17 (4*H*, s), 1.05 (6*H*, s), 1.02 (6*H*, s). ¹³C NMR (75 MHz, DMSO-d₆): δ 27.2, 36.8, 42.4, 52.2, 56.4, 112.2, 114.6, 115.2, 123.4, 136.8, 146.6, 148.4, 198.2. IR spectrum was taken on Shimadzu IR-408 Perkin Elmer 1800 (FTIR).

^1H NMR was recorded on Bruker Avance 300 MHz with TMS as an internal standard and 75 MHz for ^{13}C NMR. Spectrum was recorded in DMSO-d₆. The melting point was taken on Thermo Fisher digital melting point apparatus of IA9000 series and is uncorrected.

S3. Refinement

All hydrogen atoms were positioned geometrically [C–H = 0.95–1.00 Å] and refined using a riding model, with $U_{\text{iso}}(\text{H})$ = 1.2 or 1.5 $U_{\text{eq}}(\text{C})$. A rotating-group model were applied for methyl groups.

 $\Delta\rho_{\min} = -0.28 \text{ e } \text{\AA}^{-3}$

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
