## [6]Cyclo-2,7-naphthylene: a redetermination

## Waka Nakanishi, Jing Yang Xue, Tomoaki Yoshioka and Hiroyuki Isobe*

Department of Chemistry, Tohoku University, Aoba-ku, Sendai, 980-8578, Japan Correspondence e-mail: isobe@m.tohoku.ac.jp

Received 31 May 2011; accepted 16 June 2011
Key indicators: single-crystal X-ray study; $T=100 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.004 \AA$; $R$ factor $=0.066 ; w R$ factor $=0.181$; data-to-parameter ratio $=16.1$.

Single crystals of a macrocyclic hydrocarbon, [6]cyclo-2,7naphthylene ([6]CNAP, $\mathrm{C}_{60} \mathrm{H}_{36}$ ) were prepared from anthracene melt with a prolonged time for the recrystallization. The crystal of improved quality led to the correction of the spacegroup assignment to Cmca from $P \overline{1}$ in the original determination [Nakanishi et al. (2011) Angew. Chem. Int. Ed. 50, 53235326] and the refinement of anisotropic displacement parameters of all C atoms. The refined molecular structure with $C_{2 h}$ point symmetry indicated that the strain on the naphthyl rings of [6]CNAP is smallest among the congeners. Despite the large macrocyclic structure, molecules are packed in a ubiquitous herringbone motif. A short $\mathrm{C}-\mathrm{C}$ distance of 3.119 (4) $\AA$ was found in the stacking direction, and a short $\mathrm{C}-\mathrm{H}$ distance of $2.80 \AA$ was found in the intercolumnar contact.

## Related literature

Superior quality crystals of the title compound were obtained by re-optimizing the crystallization conditions. For the synthesis and preceding crystallographic analysis, see: Nakanishi et al. (2011). For the original method of recrystallization, see: Miyahara \& Shimizu (2001). For a review of $\mathrm{C}-\mathrm{H} \cdots \pi$ contacts in crystals, see: Nishio (2004).

## [6]Cyclo-2,7-naphthylene: a redetermination

Waka Nakanishi, Jing Yang Xue, Tomoaki Yoshioka and Hiroyuki Isobe

## S1. Comment

Polycyclic aromatic hydrocarbons are important compounds for the development of organic electronics. As new bipolar carrier transport materials for organic light emitting diodes, we recently reported [n]cyclo-2,7-naphthylenes ([n]CNAP; Nakanishi et al., 2011). The unique macrocyclic structures of $[n]$ CNAPs $(n=5,6$ and 7$)$ were revealed by X-ray crystallographic analysis of the single crystals, but we deferred detailed discussion of the most abundant compounds, [6]CNAP, because of insufficient quality of available data mainly due to weak reflections from the previous crystals. We now obtained single crystals of [6]CNAP with superior quality by re-optimizing the crystallization conditions and successfully corrected the space group assignment to Cmca. The molecular structure of title compound is shown in Fig. 1, and the packing structure is shown in Fig. 2. Most importantly, the refined molecular structure with $C_{2 h}$ point symmetry shows that [6]CNAP has the smallest deformation in the planar naphthyl rings with the average bend angle of $2.3^{\circ}$ which is smaller than $16^{\circ}$ and $5^{\circ}$ of [5]- and [7]CNAPs, respectively. To form the strain-free macrocycle, the naphthyl rings are twisted alternately with dihedral angles of $33.1(3)^{\circ}$ and $25.6(4)^{\circ}$. Despite the large macrocyclic structure, molecules are packed in a ubiquitous herringbone motif. A short C-C distance of 3.119 (4) $\AA$ was found in the stacking direction, and a short C-H distance of $2.80 \AA$ was found in the intercolumnar contact.

## S2. Experimental

The title compound was synthesized by a nickel promoted coupling reaction of 2,7-dibromonaphthalene and separated as reported in literature (Nakanishi et al., 2011). A single crystal suitable for X-ray crystallographic analysis was obtained by a solid solvent growth method, as reported except that the time for crystal growth was extended: A mixture of anthracene $(200 \mathrm{mg})$ and [6]CNAP ( 4 mg ) was sealed in a glass tube. The whole glass tube was heated at $350{ }^{\circ} \mathrm{C}$ for 2 h . The subsequent crystal-growing time at $210^{\circ} \mathrm{C}$ was extended from 2 h to 3 h , and the tube was cooled gradually to ambient temperature. A half of the glass tube was then heated at $200^{\circ} \mathrm{C}$ to eliminate anthracene and afford crystals of [6]CNAP. For the original method of recrystallization, see: Miyahara \& Shimizu (2001).

## S3. Refinement

H atoms were included in calculated positions and treated as riding atoms, with $\mathrm{C}-\mathrm{H}=0.95 \AA($ aromatic $)$ and $U_{\text {iso }}(\mathrm{H})=$ $1.2 U_{\mathrm{eq}}(\mathrm{C})$.

Figure 1
The molecular structure of the title compound with displacement ellipsoids drawn at the $50 \%$ probability level. Symmetry codes: (i) $x,-y+2,-z+1$; (ii) $-x+1, y, z$; (iii) $-x+1,-y+2,-z+1$.

Figure 2
The packing structure of the title compound, viewed along the $a$ axis.

$\Delta \rho_{\text {max }}=0.20 \mathrm{e}^{-3}$
$\Delta \rho_{\text {min }}=-0.35 \mathrm{e}_{\AA^{-3}}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two 1.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
