Received 14 June 2011; accepted 6 July 2011

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ,  $P = 0.0\text{ kPa}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.034;  $wR$  factor = 0.086; data-to-parameter ratio = 15.5.

The title heterocyclic compound,  $\text{C}_{20}\text{H}_{17}\text{NO}_3\text{S}$ , was synthesized by condensation of ethyl cyanoacetate with (*Z*)-2-benzylidenebenzo[*b*]thiophen-3(2*H*)-one in the presence of a basic catalyst in ethanol. The phenyl and ester groups make dihedral angles of 77.67 (6) and 8.52 (6) $^\circ$ , respectively, with the benzothienopyran ring system [maximum r.m.s. deviation = 0.1177 (13)  $\text{\AA}$ ]. In the crystal, centrosymmetric dimers are formed through pairs of N—H $\cdots$ O hydrogen bonds between the amine and ester groups. Intermolecular C—H $\cdots$ N hydrogen bonds and C—H $\cdots$  $\pi$  interactions involving the thiophene ring are also observed.

## Ethyl 2-amino-4-phenyl-4H-1-benzothieno[3,2-*b*]pyran-3-carboxylate

**Adil Boughaleb, Hafid Zouihri, Said Gmouh, Abdelali Kerbal and Mohamed El yazidi**

### S1. Comment

The Michael addition of carbanions to the C=C double bond of  $\alpha,\beta$ -unsaturated ketones, nitriles, amides and esters is a method of choice for the formation of C—C bonds (Czarnocki *et al.*, 2005; Rossiter & Swingle, 1992; Perlmutter, 1992).

In this work we have studied the behavior of ethylcyanoacetate with respect to (*Z*)-2-benzylidenebenzo[*b*]thiophen-3(2*H*)-one and derivatives in ethanol, with the presence of piperidine as catalyst. We have shown that cyclo-condensation starts with a Michael 1,4-addition, followed by intramolecular cyclization *via* nucleophilic addition of the hydroxyl group to the cyano group and not onto the carboxylate, to give the tricyclic heterocycle ethyl 2-amino-4-phenyl-4*H*-[1] benzothieno[3,2-*b*]pyran-3-carboxylate. The structural study by X-ray diffraction is in perfect agreement with the results of spectroscopic analysis: IR, <sup>1</sup>H- and <sup>13</sup>C-NMR.

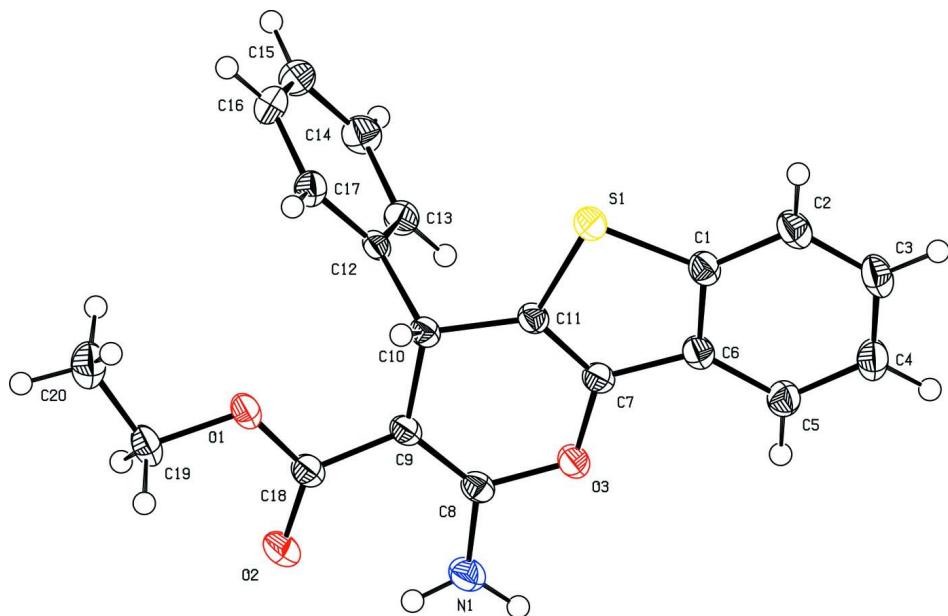

In the title compound, C<sub>20</sub>H<sub>17</sub>NO<sub>3</sub>S (Fig. 1), the phenyl and ester groups make dihedral angles of 77.67 (6)° and 8.52 (6)°, respectively, with the benzothienopyran ring system. In the crystal, two molecules are linked about a center of inversion by pairs of N—H···O hydrogen bonds, generating a dimer (Fig. 2). Intermolecular C—H···N hydrogen bonds and C—H···π interactions (between C15—H15 bond of the phenyl group and the centroid of the thiophene ring with symmetry code: *x*+1, *y*, *z*) are also observed (Table 1).

### S2. Experimental

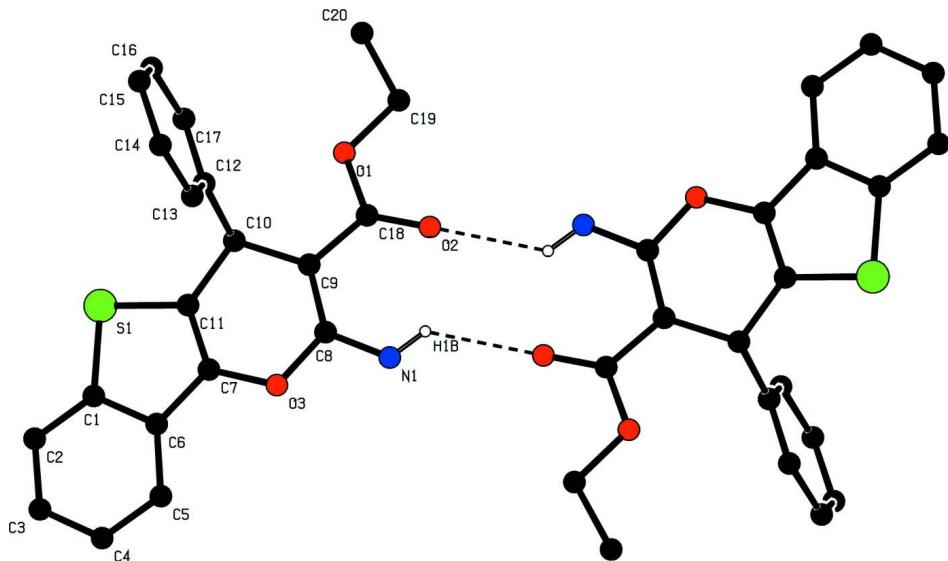

In a 100 ml flask equipped with a condenser, was dissolved 4 mmol of (*Z*)-2-benzylidenebenzo[*b*]thiophen-3(2*H*)-one and 5 mmol of ethyl cyanoacetate in 30 ml of ethanol. Then, 1ml of piperidine was added, and the reaction mixture was refluxed for 6 h. Thin layer chromatography revealed the formation of a single product. The organic phase was evaporated under reduced pressure. The resulting residue was recrystallized from ethanol.

### S3. Refinement

All H atoms bound to C atoms were treated as riding to their parent atoms [C—H distances are 0.93 Å for aromatic CH groups, 0.97 Å for methylene CH<sub>2</sub> groups, 0.96 Å for the CH<sub>3</sub> methyl group, and 0.98 Å for the CH methine group]. Isotropic displacement parameters are calculated as  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C}20)$  for the methyl group and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{parent C})$  for other H atoms. The amine H atoms H1A and H1B were found in a difference map, and refined with N—H bond lengths restrained to 0.88 (2) Å and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{N}1)$ .

**Figure 1**

Molecular view of the title compound showing displacement ellipsoids at the 30% probability level. H atoms are represented as small spheres of arbitrary radii.

**Figure 2**

Partial view of the crystal packing, showing the N—H···O bonded dimers (symmetry code:  $-x, -y+1, -z$ ). H atoms not involved in hydrogen bonds have been omitted for clarity.

*Hydrogen-bond geometry (Å, °)*

Cg1 is the centroid of the thiophene ring.

D—H···A	D—H	H···A	D···A	D—H···A
N1—H1B···O2 <sup>i</sup>	0.838 (19)	2.285 (19)	2.9143 (16)	132.1 (15)
C10—H10···N1 <sup>ii</sup>	0.98	2.57	3.5189 (17)	164
C15—H15···Cg1 <sup>iii</sup>	0.93	2.95	3.7493 (15)	145

Symmetry codes: (i)  $-x, -y+1, -z$ ; (ii)  $x, y+1, z$ ; (iii)  $x+1, y, z$ .
