Received 6 July 2011; accepted 17 July 2011
Key indicators: single-crystal X-ray study; $T=293 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.010 \AA$; $R$ factor $=0.052 ; w R$ factor $=0.148 ;$ data-to-parameter ratio $=16.7$.

The centrosymmetric dimeric title complex, $\left[\mathrm{Zn}_{2} \mathrm{Br}_{4}-\right.$ $\left.\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{4}\right)_{2}\right]$, is isotypic with its $\left[\mathrm{Zn}_{2} \mathrm{Cl}_{4}\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{4}\right)_{2}\right]$, $\left[\mathrm{Zn}_{2} \mathrm{I}_{4}-\right.$ $\left.\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{4}\right)_{2}\right]$ and $\left[\mathrm{Co}_{2} \mathrm{Cl}_{4}\left(\mathrm{C}_{4} \mathrm{H}_{8} \mathrm{~N}_{4}\right)_{2}\right]$ analogues. The zinc atom is bonded to two N atoms belonging to triazole bridging rings and to two terminal bromide ligands, in a geometry close to tetrahedral. Weak $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bonds, with the amine functions as donor groups, are observed in the crystal structure, forming a three-dimensional supramolecular network.

## S1. Comment

Transition metal complexes bridged by 1,2,4-triazole group can produce interesting structures and specific properties. Many attempts have been made to synthesize a variety of complexes with paramagnetic centers by using such ligands, and their structures and magnetic properties have been characterized (Liu et al., 1999). For 4-amino-3,5-dimethyl-1,2,4triazole (admt), several Cu ${ }^{\text {II }}$ (Liu et al., 2003), $\mathrm{Co}^{\mathrm{II}}, \mathrm{Ni}^{\mathrm{II}}$ (Zhao et al., 2002; Gong et al., 2009), and Cd $\mathrm{Cl}^{\mathrm{II}}$ compounds (Yi et al., 2004) were synthesized. However, to the best of our knowledge, only two $\mathrm{Zn}^{\mathrm{II}}$-admt compounds, $\left[\mathrm{Zn}_{2}\left(\mathrm{admt}_{2} \mathrm{Cl}_{4}\right]\right.$ and $\left[\mathrm{Zn}_{2}(\mathrm{admt})_{2} \mathrm{I}_{4}\right]$ were synthesized (Lavrenova et al., 1992; Zhang et al., 2011). Here, we report the preparation and crystal structure of a dimeric $\mathrm{Zn}^{\mathrm{II}}$ complex of formula $\left[\mathrm{Zn}_{2}(\mathrm{admt})_{2} \mathrm{Br}_{4}\right]$.
The structure of the title compound is made up of neutral dimeric metallacycles. The title compound is isostructural to analogous complexes which were previously reported: $\left[\mathrm{Zn}_{2}(\mathrm{admt})_{2} \mathrm{Cl}_{4}\right],\left[\mathrm{Zn}_{2}(\mathrm{admt})_{2} \mathrm{I}_{4}\right]$ and $\left[\mathrm{Co}_{2}(\mathrm{admt})_{2} \mathrm{Cl}_{4}\right]$ (Lavrenova et al., 1992; Zhang et al., 2011; Gong et al., 2009). In each dimeric metallacycle, as shown in Fig. 1, two $\mathrm{Zn}^{\text {II }}$ centers are connected by two admt ligands, resulting in a discrete $\mathrm{Zn}_{2}(\text { admt })_{2} 6$-membered metallacycle, which represents the smallest closed cyclic structure with a 1:1 metal-to-ligand ratio. Two triazole rings are coplanar. Each $\mathrm{Zn}^{\mathrm{II}}$ center is fourcoordinated with two N donors of two admt ligands $\left[\mathrm{Zn} 1 — \mathrm{~N} 1: 2.027\right.$ ( 6 ) $\AA ; \mathrm{Zn} 1 — \mathrm{~N} 2^{\mathrm{i}}$ (symmetry code i: 2-x, 2-y, 1-z): 2.025 (6) $\AA$ ] and two Br anions ligands [ $\mathrm{Zn} 1 — \mathrm{Br} 1: 2.3523$ (12) $\AA ; \mathrm{Zn} 1-\mathrm{Br} 2: 2.3625$ (12) $\AA$ ], forming a distorted tetrahedral geometry. The $\mathrm{Zn}-\mathrm{N}($ triazole $)$ bond lengths in the title compound are consistent with values in other $\mathrm{Zn}-$ triazole complexes (Zhang et al., 2007, 2011; Lavrenova et al., 1992). The $\mathrm{N}-\mathrm{Zn}-\mathrm{N}, \mathrm{N}-\mathrm{Zn}-\mathrm{Br}$ and $\mathrm{Br}-\mathrm{Zn}-\mathrm{Br}$ bond angles in the title compound are in the range of $107.5(2)^{\circ}$ to $113.53(5)^{\circ}$, near to the ideal tetrahedral value of $c a$ $109.5^{\circ}$. The ligand admt is a 4 -substituted $1,2,4$-triazole and exhibits in the title compound the $\kappa^{2} N^{1}: N^{2}$ bidentate bridging coordination mode. Two admt ligands bridge two $\mathrm{Zn}^{\mathrm{II}}$ ions to form a dimer with a $\mathrm{Zn} \cdots \mathrm{Zn}$ separation of 3.7781 (6) $\AA$. For a 4 -substituted 1,2,4-triazole, by blocking the N 4 donor position through substitution, only the N1 monodentate (Zhang et al., 2007) and N1,N2-bidentate coordination modes are possible.
There are weak hydrogen bonding interactions between the H atoms of the amine $\mathrm{NH}_{2}$ groups and the $\mathrm{Br}^{-}$anions of adjacent dimers $\left(\mathrm{N} 4-\mathrm{Br}^{\mathrm{ii}}=3.428\right.$ (7) $\AA, \mathrm{N} 4-\mathrm{Br} 2^{\mathrm{iii}}=3.748$ (8) $\AA$; symmetry codes: $\mathrm{ii}=1-x, 3 / 2-y, z-1 / 2$; iii $=x, 3 / 2-y$, $z-1 / 2)$. The adjacent dimers are held together by $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bonds to form a three-dimensional supramolecular network (Fig. 2). No obvious $\pi \cdots \pi$ stacking interactions between the triazole rings are observed in the crystal structure.

## S2. Experimental

To a solution of admtrz in EtOH was added one equivalent of $\mathrm{ZnBr}_{2}$ (aqueous solution) under stirring at room temperature. Then, the reaction mixture was filtered and colorless crystals suitable for structure determination were isolated by slow evaporation of the solvent at room temperature after a couple of weeks.

## S3. Refinement

H atoms of the methyl groups were placed in idealized positions and refined as riding, with $\mathrm{C}-\mathrm{H}$ distances of $0.96 \AA$ and $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}($ parent C$)$. H atoms bonded to N 4 were located in a difference map and refined with $\mathrm{N}-\mathrm{H}$ distances restrained to $0.85(2) \AA$, and with $U_{\text {iso }}(\mathrm{H})=1.2 U_{\text {eq }}(\mathrm{N} 4)$.
