Received 25 June 2011; accepted 30 June 2011

Key indicators: single-crystal X-ray study; $T=298 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.011 \AA$; $R$ factor $=0.055 ; w R$ factor $=0.126$; data-to-parameter ratio $=17.2$.

The centrosymmetric title compound, $\left[\mathrm{Cd}\left(\mathrm{C}_{9} \mathrm{H}_{9} \mathrm{BrNO}_{2}\right)_{2}\right]$, was obtained by the reaction of 5-bromosalicylaldehyde, 2-aminoethanol and cadmium nitrate in ethanol. The Cd atom, located on an inversion centre, is hexacoordinated by two Schiff base ligands in an octahedral coordination through the phenolate O atom, the imine N atom and the hydroxy O atoms. In the crystal, molecules are linked through intermolecular $\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming chains along the $b$ axis.

## S1. Comment

Schiff base cadmium(II) complexes have been received much attention due to their interesting structures and luminescent properties (Sarkar et al., 2011; Das et al., 2010; Fang \& Nie, 2010; Niu et al., 2010; Keypour et al., 2009).
The molecule of the title complex, (I) (Fig. 1), is centrosymmetric, with the inversion center located at the Cd atom. The Cd atom is hexa-coordinated by two Schiff base ligands, forming an octahedral coordination. The Schiff base coordinates to the Co atom through the phenolate O atom, the imine N atom, and the hydroxy O atom. The bond lengths are within normal values. In the crystal, molecules are linked through intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds (Table 1), to form chains along the $b$ axis, Fig. 2.

## S2. Experimental

To a solution of 5-bromosalicylaldehyde $(0.181 \mathrm{~g}, 1.0 \mathrm{mmol})$, 2-aminoethanol $(0.061 \mathrm{~g}, 1.0 \mathrm{mmol})$ in 20 ml absolute ethanol was added slowly a solution of cadmium nitrate $(0.154 \mathrm{~g}, 0.5 \mathrm{mmol})$ in ethanol. The mixture was stirred for 2 h at room temperature to give a colorless solution, which was filtered and the filtrate was left to stand at room temperature. Colorless block crystals suitable for X-ray diffraction were obtained by slow evaporation.

## S3. Refinement

H 2 atom bonded to O 2 atom was located in a difference map and refined with distance restraint of $\mathrm{O}-\mathrm{H}=0.85$ (1) $\AA$. Other H atoms were positioned geometrically and refined using a riding model, with $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$.

## Figure 1

The molecular structure of (I), with atom labels and $30 \%$ probability displacement ellipsoids for non-H atoms. Unlabelled atoms are at the symmetry position $1 / 2-x, y, 1 / 2-z$.

Figure 2
The packing of (I), viewed down the $c$ axis. Hydrogen bonds are drawn as dashed lines. H atoms not involved in hydrogen bonding have been omitted.

## Refinement

Refinement on $F^{2}$
Least-squares matrix: full
$R\left[F^{2}>2 \sigma\left(F^{2}\right)\right]=0.055$
$w R\left(F^{2}\right)=0.126$
$S=1.02$
2172 reflections
126 parameters
1 restraint
Primary atom site location: structure-invariant
direct methods
$F(000)=580$
$D_{\mathrm{x}}=1.985 \mathrm{Mg} \mathrm{m}^{-3}$
Mo $K \alpha$ radiation, $\lambda=0.71073 \AA$
Cell parameters from 1609 reflections
$\theta=2.5-24.4^{\circ}$
$\mu=5.11 \mathrm{~mm}^{-1}$
$T=298 \mathrm{~K}$
Block, colorless
$0.23 \times 0.20 \times 0.20 \mathrm{~mm}$

7794 measured reflections
2172 independent reflections
1524 reflections with $I>2 \sigma(I)$
$R_{\text {int }}=0.039$
$\theta_{\text {max }}=27.0^{\circ}, \theta_{\text {min }}=2.1^{\circ}$
$h=-13 \rightarrow 12$
$k=-6 \rightarrow 6$
$l=-23 \rightarrow 23$

Secondary atom site location: difference Fourier map
Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.034 P)^{2}+5.8476 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}<0.001$
$\Delta \rho_{\text {max }}=1.41 \mathrm{e}_{\AA^{-3}}$
$\Delta \rho_{\text {min }}=-1.55 \mathrm{e}^{-3}$

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.
