Received 9 July 2011; accepted 10 July 2011

Key indicators: single-crystal X-ray study;  $T = 193\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  
 $R$  factor = 0.041;  $wR$  factor = 0.124; data-to-parameter ratio = 12.0.

In the title compound,  $\text{C}_{25}\text{H}_{16}\text{N}_2\text{O}_8$ , the dihedral angle between the naphthalene ring system and the benzene ring of the nitrophenyl ketone unit is  $82.64(7)^\circ$ . The bridging ester  $\text{O}=\text{C}(=\text{O})-\text{C}$  plane makes dihedral angles of  $42.12(8)$  and  $11.47(9)^\circ$ , respectively, with the naphthalene ring system and the benzene ring of the nitrophenyl ester unit. In the crystal, two types of weak intermolecular  $\text{C}-\text{H}\cdots\text{O}$  interactions are observed.

## 7-Methoxy-1-(4-nitrobenzoyl)naphthalen-2-yl 4-nitrobenzoate

Toyokazu Muto, Daichi Hijikata, Akiko Okamoto, Hideaki Oike and Noriyuki Yonezawa

### S1. Comment

In the course of our study on electrophilic aromatic aroylation of 2,7-dimethoxynaphthalene, *peri*-aroylnaphthalene compounds have proven to be formed regioselectively with the aid of suitable acidic mediators (Okamoto & Yonezawa, 2009). Recently, we have reported the crystal structures of several 1,8-diaroylated naphthalene homologues exemplified by 1,8-bis(4-methylbenzoyl)-2,7-dimethoxynaphthalene (Muto *et al.*, 2010). The aroyl groups at the 1,8-positions of the naphthalene rings in these compounds are twistedly connected in an almost perpendicular fashion, but the benzene ring moieties of the aroyl groups tilt slightly toward the *exo* sides of the naphthalene rings. The crystal structures of 1-monoaroylated naphthalene compounds such as 2,7-dimethoxy-1-(4-nitrobenzoyl)naphthalene (Watanabe *et al.*, 2010) also exhibit essentially the same non-coplanar structure as the 1,8-diaroylated naphthalenes. Furthermore, the crystal structures of several 1-monoaroylated naphthalene derivatives have revealed. For example, (2-hydroxy-7-methoxy-naphthalen-1-yl)(4-methylphenyl)methanone (Nagasaki *et al.*, 2010) and (4-chlorophenyl)(2-hydroxy-7-methoxy-naphthalen-1-yl)methanone (Mitsui, Nakaema, Noguchi & Yonezawa, 2008) prepared by regioselective demethylation form intramolecular hydrogen bond between the carbonyl group and the adjacent hydroxy one. Besides, (4-chlorobenzoyl)(2-ethoxy-7-methoxynaphthalen-1-yl)methanone (Mitsui *et al.*, 2009) has similar non-coplanar configuration to 1-(4-chlorobenzoyl)-2,7-dimethoxynaphthalene (Mitsui, Nakaema, Noguchi, Okamoto & Yonezawa, 2008). As a part of our continuous studies on the molecular structures of this kind of homologous molecules, the crystal structure of the title compound, 1-monoaroylated naphthalene bearing 4-nitrobenzoyloxy group at 2-position is discussed in this report.

The molecular structure of the title compound is displayed in Fig. 1. The benzene ring of nitrophenyl ketone moiety (C12–C17) is out of the plane of the naphthalene ring. The dihedral angle between the best planes of the benzene ring (C12–C17) and the naphthalene ring system (C1–C10) is 82.64 (7) $^{\circ}$  [C2–C1–C11–O1 torsion angle = -79.8 (2) $^{\circ}$ ]. However, the carbonyl group (C11=O1) and the benzene ring (C12–C17) have almost coplanar configuration [O1–C11–C12–C17 torsion angle = 5.0 (2) $^{\circ}$ ]. Besides, the dihedral angle between the benzene ring (C12–C17) and the nitro group plane (O4/N1/O5) is 29.35 (9) $^{\circ}$ . On the other hand, the benzene ring of nitrophenyl ester moiety (C19–C24) makes a rather small dihedral angle with naphthalene ring system (C1–C10) than that with the benzene ring of nitrophenyl ketone moiety (C12–C17), *i.e.*, 31.38 (7) $^{\circ}$ . Moreover, the dihedral angles of the benzene ring (C19–C24) and the naphthalene ring system (C1–C10) with the ester plane (O2—C18(=O6)—C19) are 11.47 (9) $^{\circ}$  and 42.12 (8) $^{\circ}$ , respectively. The nitro group plane (O7/N2/O8) makes a small dihedral angle of 6.47 (10) $^{\circ}$  with the benzene ring (C19–C24). In the crystal structure, the molecular packing of the title compound is stabilized mainly by van der Waals interactions. The crystal packing is additionally stabilized by intermolecular C—H $\cdots$ O interaction between the oxygen atom (O7) of the nitro group in nitrophenyl ester and one hydrogen atom (H6) of the naphthalene ring of the adjacent molecule (C6—H6 $\cdots$ O7<sup>i</sup>; Fig. 2 and Table 1). Moreover, there is also intermolecular C—H $\cdots$ O interaction between the oxygen atom (O4) of the nitro group in nitrophenyl ketone and one hydrogen atom (H23) of the nitrophenyl ester of the adjacent molecule (C23—H23 $\cdots$ O4<sup>ii</sup>; Fig. 3 and Table 1).

**S2. Experimental**

To a 100 ml flask, 4-nitrobenzoyl chloride (17 mmol, 3.173 g), aluminium chloride (18.7 mmol, 2.495 g) and methylene chloride (21 ml) were placed and stirred at 273 K. To the reaction mixture thus obtained, 2,7-dimethoxynaphthalene (8.5 mmol, 1.599 g) was added. After the reaction mixture was stirred at 273 K for 60 h, it was poured into ice-cold water (10 ml). The aqueous layer was extracted with  $\text{CHCl}_3$  (10 ml  $\times$  3). The combined extracts were washed with 2 M aqueous NaOH followed by washing with brine. The organic layers thus obtained were dried over anhydrous  $\text{MgSO}_4$ . The solvent was removed under reduced pressure to give cake. The crude product was purified by silica-gel chromatography from  $\text{CHCl}_3$ . Yellow platelet single crystals suitable for X-ray diffraction were obtained by crystallization from ethanol (10 mg, 0.2% yield).

$^1\text{H}$  NMR  $\delta$  (300 MHz,  $\text{CDCl}_3$ ): 3.75 (3H, s), 6.91 (1H, d,  $J$  = 2.4 Hz), 7.24 (1H, dd,  $J$  = 2.4, 9.0 Hz), 7.34 (1H, d,  $J$  = 8.4 Hz), 7.89 (1H, d,  $J$  = 9.0 Hz), 7.98 (2H, d,  $J$  = 9.0 Hz), 8.00 (2H, d,  $J$  = 8.4 Hz), 8.04 (1H, d,  $J$  = 9.0 Hz), 8.21 (2H, d,  $J$  = 8.4 Hz), 8.22 (2H, d,  $J$  = 9.3 Hz) p.p.m..

$^{13}\text{C}$  NMR  $\delta$  (75 MHz,  $\text{CDCl}_3$ ): 55.32, 103.27, 118.37, 119.57, 123.65, 123.93, 125.45, 127.27, 130.14, 130.39, 131.00, 132.03, 132.54, 133.55, 141.98, 146.62, 150.55, 150.96, 159.37, 162.57, 194.18 p.p.m..

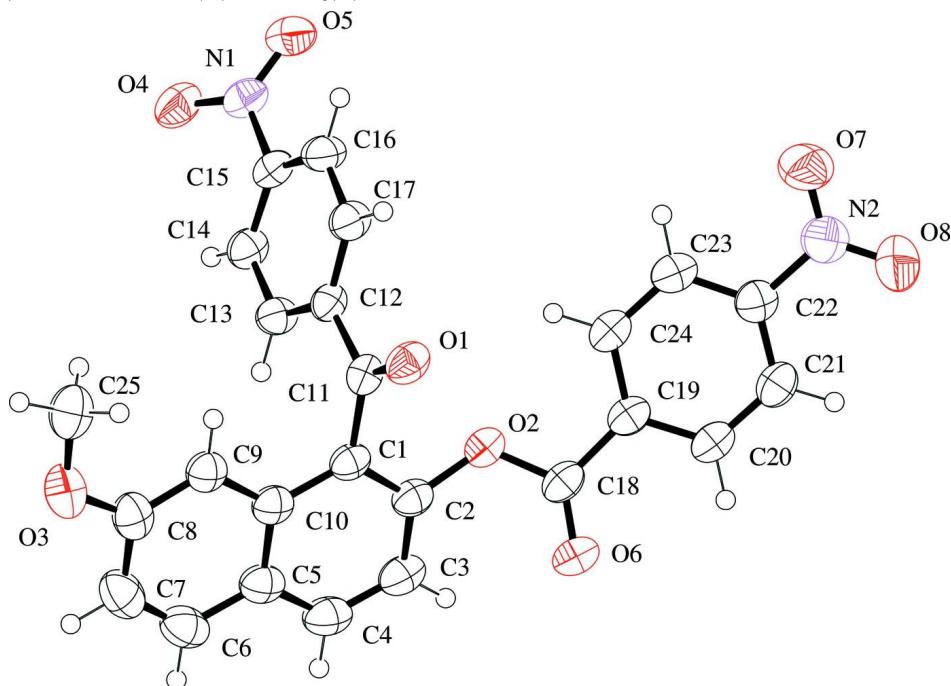

IR (KBr): 1746, 1679, 1619, 1525, 1349, 1234, 1208  $\text{cm}^{-1}$

HRMS (m/z): [M + H]<sup>+</sup> Calcd for  $\text{C}_{25}\text{H}_{17}\text{N}_2\text{O}_8$ , 473.0985; found, 473.0977.

m.p. = 452.0–454.0 K

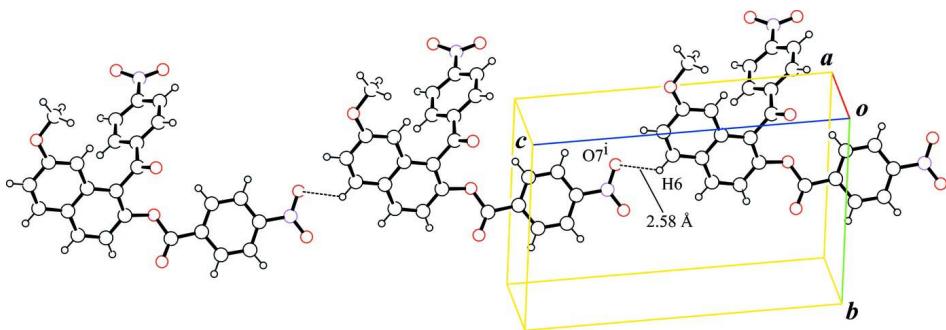

**S3. Refinement**

All H atoms were found in a difference map and were subsequently refined as riding atoms, with C—H = 0.95 (aromatic) and 0.98 (methyl) Å, and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

Extinction coefficient: 0.0109 (9)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
