Received 15 July 2011; accepted 26 July 2011

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(C-C) = 0.009$ Å; R factor = 0.031; wR factor = 0.070; data-to-parameter ratio = 9.9.

In the title three-dimensional compound, $[CoSm_6(C_5H_2N_2O_4)_4(SO_4)_6 \cdot (H_2O)_{14}]_n$, the Co^{II} ion is six-coordinated with two O atoms and two N atoms from two imidazole-4,5-dicarboxylate ligands and two coordinated water molecules, giving a slightly distorted octahedral geometry. One Sm^{III} ion is eight-coordinated in a bicapped trigonal-prismatic coordination geometry by four O atoms from two imidazole-4,5-dicarboxylate ligands, two O atoms from two SO₄²⁻ anions and two coordinated water molecules. The other two Sm^{III} ions are nine-coordinated in a tricapped trigonal-prismatic coordination geometry; one of these Sm^{III} ions is bonded to four O atoms from two imidazole-4,5-dicarboxylate ligands, three O atoms from three SO₄²⁻ anions and two water O atoms, and the other Sm^{III} ion is coordinated by one O atom and one N atom from one imidazole-4,5-dicarboxylate ligand, five O atoms from three SO₄²⁻ anions, as well as two coordinated water molecules. The crystal structure is further stabilized by N—H···O, O—H···O, and C—H···O hydrogen-bonding interactions.

Li-Cai Zhu and Si-Ming Zhu

S1. Comment

In the past few years, lanthanide-transition metal heterometallic complexes with bridging multifunctional organic ligands gained increasing interest, not only because of their impressive topological structures, but also due to their versatile applications in ion exchange, magnetism, bimetallic catalysis and as luminescent probes (Cheng *et al.*, 2006; Kuang *et al.*, 2007; Sun & Yang, 2007; Zhu *et al.*, 2010). As an extension of this research, the structure of the title compound, a new heterometallic coordination polymer has been determined which is presented in this article.

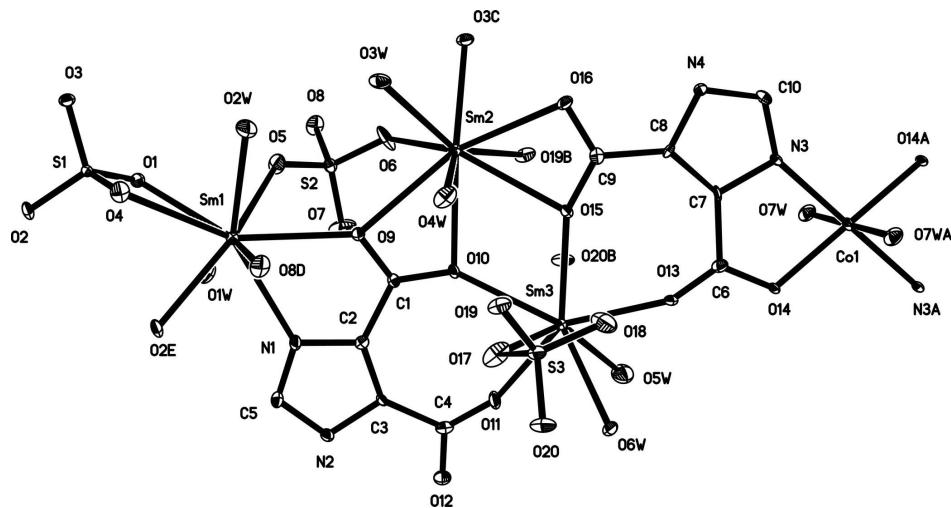

The asymmetric unit of the title compound (Fig. 1), contains a Co^{II} ion, three Sm^{III} ions, two imidazole-4, 5-dicarboxylate ligands, three SO₄²⁻ anions, and seven coordinated water molecules. The Co^{II} ion lies in the inversion center and is six-coordinated with two O atoms from two coordinated water molecules, two O atoms and two N atoms from two imidazole-4, 5-dicarboxylate ligands, giving a slightly distorted octahedral geometry. The Sm^{III} ions exhibit three types of coordination environment. One Sm^{III} ion is eight-coordinated in a bicapped trigonal prismatic coordination geometry by four O atoms from two imidazole-4,5-dicarboxylate ligands, two O atoms from two SO₄²⁻ anions and two coordinated water molecules. The other Sm^{III} ions are nine-coordinated in a tricapped trigonal prismatic coordination geometry; one of these Sm^{III} ions is bonded to four O atoms from two imidazole-4,5-dicarboxylate ligands, three O atoms from three SO₄²⁻ anions and two water O atoms and the other Sm^{III} ion is coordinated by one O atom and one N atom from one imidazole-4, 5-dicarboxylate ligand, five O atoms from three SO₄²⁻ anions as well as two coordinated water molecules. These metal coordination units are connected by bridging imidazole-4, 5-dicarboxylate and sulfate ligands, generating a three-dimensional network (Fig. 2). The crystal structure is further stabilized by N—H···O, O—H···O, and C—H···O hydrogen-bonding interactions between water molecules, SO₄²⁻ anions, and imidazole-4, 5-dicarboxylate ligands (Table 1).

S2. Experimental

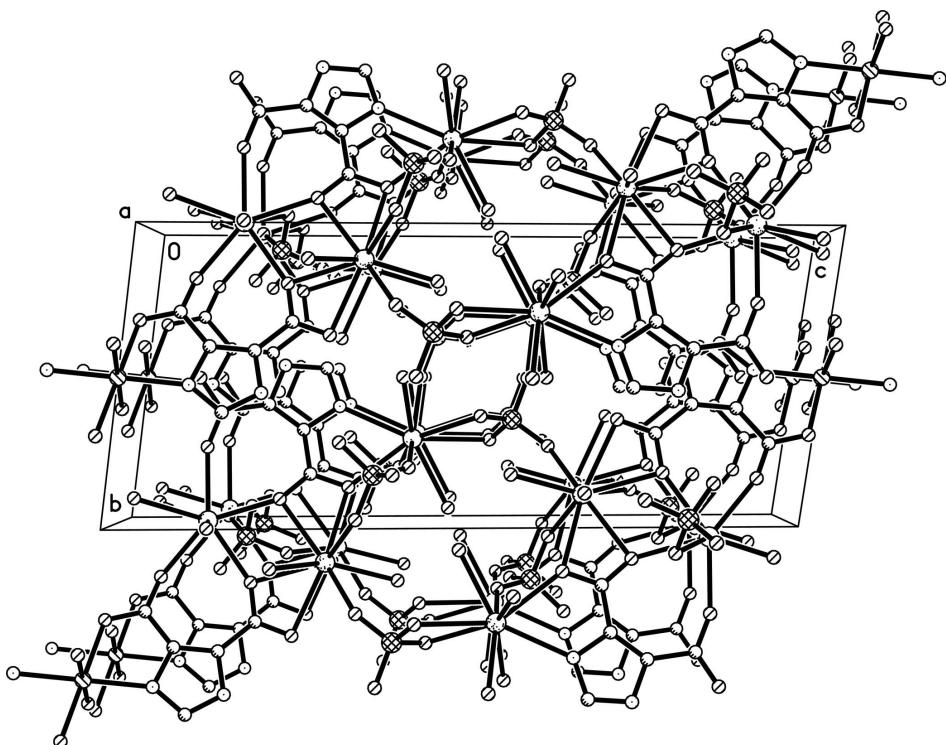

A mixture of CoSO₄·7H₂O(0.141 g, 0.5 mmol), Sm₂O₃(0.087 g, 0.25 mmol), imidazole-4,5-dicarboxylic acid (0.156 g, 1 mmol), and H₂O(10 ml) was sealed in a 20 ml Teflon-lined reaction vessel at 443 K for 5 days then slowly cooled to room temperature. The product was collected by filtration, washed with water and air-dried. Red block crystals suitable for X-ray analysis were obtained.

S3. Refinement

H atoms bonded to C atoms were positioned geometrically and refined as riding, with C—H = 0.93 Å and $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$. H atoms bonded to N atoms and H atoms of water molecules were found from difference Fourier maps and refined isotropically with a restraint of N—H = 0.87 Å, O—H = 0.82 Å and $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{N}, \text{O})$.

**Figure 1**

Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
