 Correspondence e-mail: lhshuhua@yahoo.com.cn

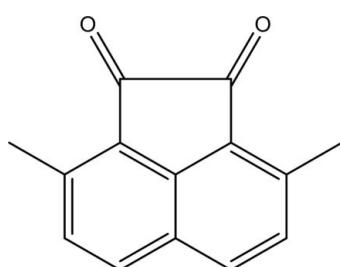

Received 9 July 2011; accepted 15 July 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.052; wR factor = 0.148; data-to-parameter ratio = 12.5.

In the title compound, $\text{C}_{14}\text{H}_{10}\text{O}_2$, the acenaphthenequinone core is essentially planar, with an r.m.s. deviation of 0.0140 \AA . In the crystal, molecules are connected by $\pi-\pi$ stacking interactions [centroid–centroid distances = $3.766(3)$, $3.839(3)$ and $3.857(3)\text{ \AA}$], forming columns parallel to the a axis.

3,8-Dimethylacenaphthylene-1,2-dione

Shu-hua He

S1. Comment

Corannulene (IUPAC name: dibenzo[*ghi,mno*]fluoranthene) and its derivatives have triggered intense interest due to their unusual bowl-formed structure (Wu & Siegel, 2006; Tsefrikas & Scott, 2006). Recently, a number of novel corannulene derivatives with excellent optical properties have been reported (Sygula, 2011; Zabula *et al.*, 2011). Up to now, different synthetic methods have been reported (Barth & Lawton, 1966; Scott *et al.*, 1997). The title compound, the synthesis of which has been reported in literatures (Guillermet *et al.*, 2009; Seiders *et al.*, 1999; Mori *et al.*, 2007), is an important intermediate in synthesizing corannulene and its derivatives. Based on the importance of the relationship between structures and properties, the crystal structure of the title compound is reported herein.

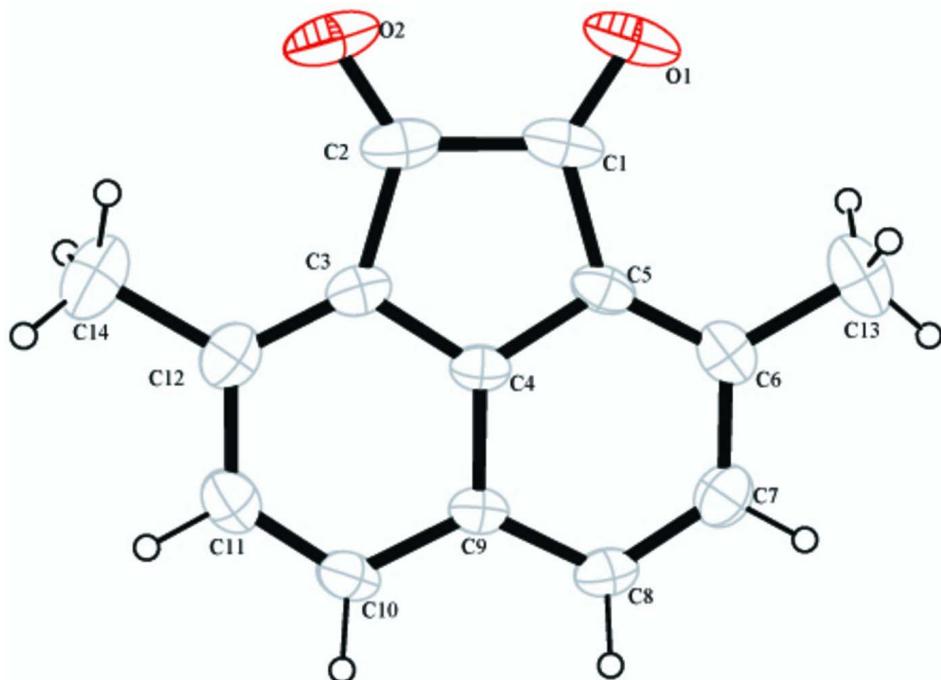

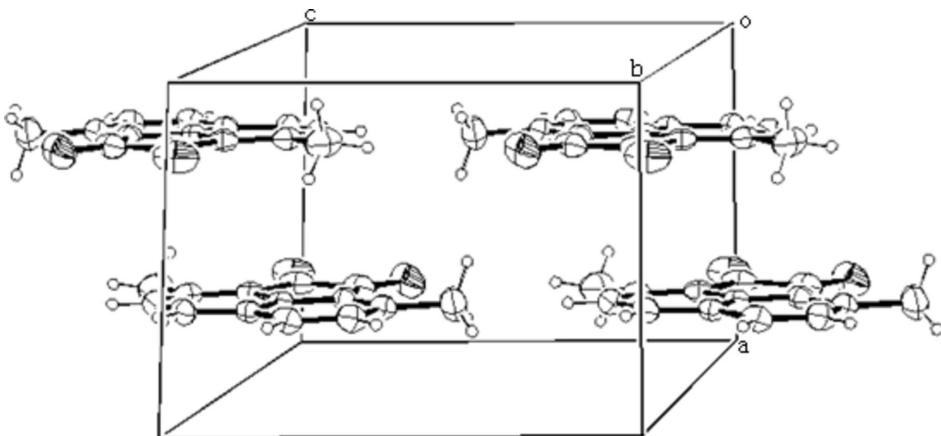

The title molecule (Fig. 1) possesses a *pseudo*-mirror plane and is substantially planar, with a r.m.s. deviation of 0.0140 Å and maximum displacement of 0.026 (3) Å for atom C8. The dihedral angles between the C1–C5 five membered ring and the C3–C4/C9–C12 and C4–C9 benzene rings are 1.42 (9) and 0.81 (9)°, respectively. The C13–C6–C5–C1, C13–C6–C7–C8, C14–C12–C3–C2 and C14–C12–C11–C10 torsion angles are 3.6 (5), 178.4 (3), 0.4 (5) and 178.5 (4)°, respectively. As already observed in related compounds (Abdourazak *et al.*, 1994; Mochida & Yoza, 2010), the C1–C2 bond length (1.569 (4) Å) is remarkably longer than expected for a C(*sp*²)–C(*sp*²) bond, and the bond angles involving the carbonyl groups (O1—C1—C5 = 130.6 (3)°, O1—C1—C2 = 123.5 (2)°, C6—C5—C1 = 133.3 (2)°) are larger than the ideal value of 120°. In the crystal (Fig. 2), molecules are linked into columns parallel to the *a* axis by π–π stacking interactions [Cg1···Cg2ⁱ = 3.766 (3) Å; Cg2···Cg2ⁱ = 3.839 (3) Å; Cg2···Cg2ⁱⁱ = 3.857 (3) Å; Cg1 and Cg2 are the centroids of the C3–C4/C9–C12 and C4–C9 rings, respectively. Symmetry codes: (i) 2–*x*, 1–*y*, 2–*z*; (ii) 1–*x*, 1–*y*, 2–*z*].

S2. Experimental

To a mixture of aluminium tribromide (10 g, 37.5 mmol) in CH₂Cl₂ (200 ml) was added dropwise a solution of 2,7-dimethylnaphthalene (2.6 g, 16.6 mmol) and oxalylchloride (2.2 ml, 26.0 mmol) in CH₂Cl₂ (150 ml) at about 253 K over 15 min. The mixture was stirred vigorously at 253 K for additional 6 h and then quenched carefully by pouring into 500 ml ice water. After 30 min, the organic layer was washed with water, dried over MgSO₄, filtered and evaporated. The residue was dissolved in a minimal amount of CH₂Cl₂ and eluted with CH₂Cl₂/hexane (1:1 *v/v*) through an alumina column to give the title compound as a bright yellow solid (1.26 g, 37% yield, m.p. 478–480 K). Bright yellow single crystals suitable for X-ray diffraction were obtained at room temperature by slow evaporation of a CH₂Cl₂ solution over a period of several days.

S3. Refinement

All H atoms were positioned geometrically (C—H = 0.93–0.96 Å) and refined using a riding model, with *U*_{iso}(H) = 1.2*U*_{eq}(C) or *U*_{iso}(H) = 1.5*U*_{eq}(C) for methyl H atoms.

 $w = 1/[\sigma^2(F_o^2) + (0.0592P)^2 + 0.102P]$
where $P = (F_o^2 + 2F_c^2)/3$ $(\Delta/\sigma)_{\max} < 0.001$ $\Delta\rho_{\max} = 0.17 \text{ e \AA}^{-3}$ $\Delta\rho_{\min} = -0.17 \text{ e \AA}^{-3}$ *Special details*

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
