Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.050;  $wR$  factor = 0.144; data-to-parameter ratio = 20.1.

In the title compound,  $\text{C}_{16}\text{H}_{16}$ , the central benzene ring adopts a boat conformation, with a dihedral angle of  $34.7(9)^\circ$  between the mean planes of the two fused benzene rings. The two methyl groups at the apex of the central benzene ring are in axial and equatorial conformations. The crystal packing is stabilized by weak  $\text{C}-\text{H}\cdots\pi$  intermolecular interactions.

### S1. Comment

Anthracene and its derivatives are long known polycyclic aromatic compounds showing a high potential for use in materials science (*e.g.* fluorescence probing, photochromic systems, electroluminescence) and several reviews have been published. Anthrone is a tricyclic aromatic hydrocarbon which is used for a popular cellulose assay and in the colorometric determination of carbohydrates (Trevelyan, 1952) and anthracene itself is used in the production of red dye alizarin. The crystal structures of anthrone (Srivastava, 1964), 10-bromoanthrone (Destro *et al.*, 1973), 9,10-dimethylanthracene (Iball & Low, 1974), benzylideneanthrone at 193 K (Ghosh *et al.*, 1993), 10-(2-methylbenzylidene)anthrone (Zhou *et al.*, 2004), 10-(3,4-dimethoxybenzylidene)anthrone (Zhou *et al.*, 2005), 10-(4-hydroxy-3-nitrobenzylidene)anthrone (Zhou *et al.*, 2007) and 10,10-dimethylanthrone (Fun *et al.*, 2010) have been reported. In view of the importance of anthracene derivatives, this paper reports the crystal structure of the title compound, (I), C<sub>16</sub>H<sub>16</sub>.

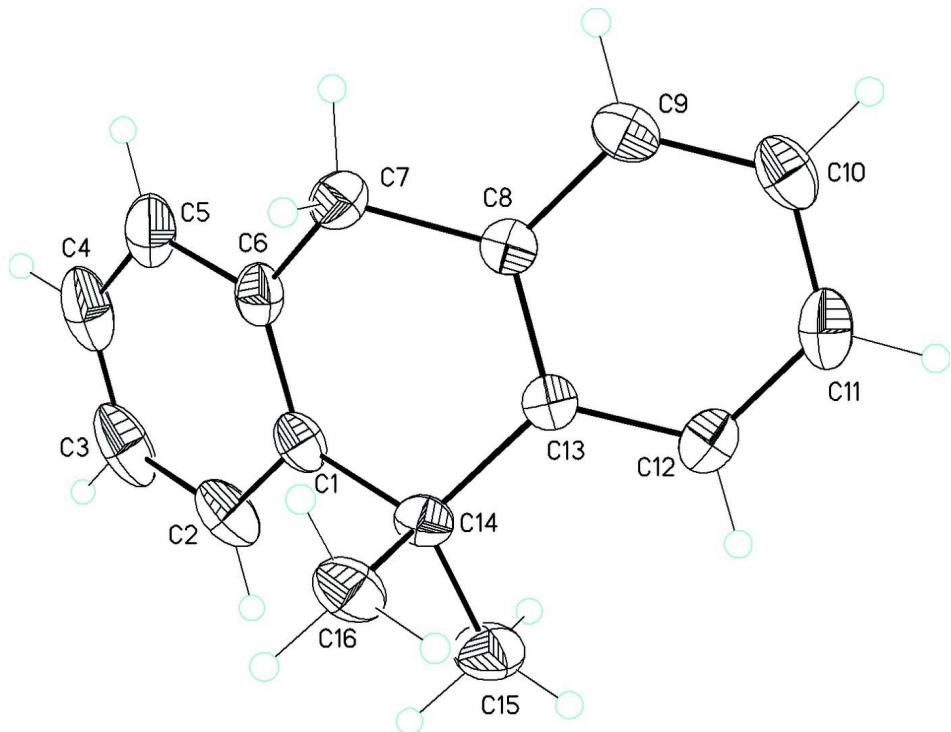

In the title compound, C<sub>16</sub>H<sub>16</sub>, the center benzene ring (C1/C6–C8/C13/C14) with puckering parameters, Q,  $\theta$ ,  $\phi$ , of 0.4930 (13) Å, 92.27 (15)°, 120.13 (15)°, adopts a boat conformation with a dihedral angle of 34.7 (9)° between the mean planes of the two fused benzene rings (Fig. 1). The two methyl groups at the apex of the center benzene ring are in axial and equatorial conformations. The crystal packing is stabilized by weak C—H···Cg  $\pi$ -ring intermolecular interactions (Fig. 2).

### S2. Experimental

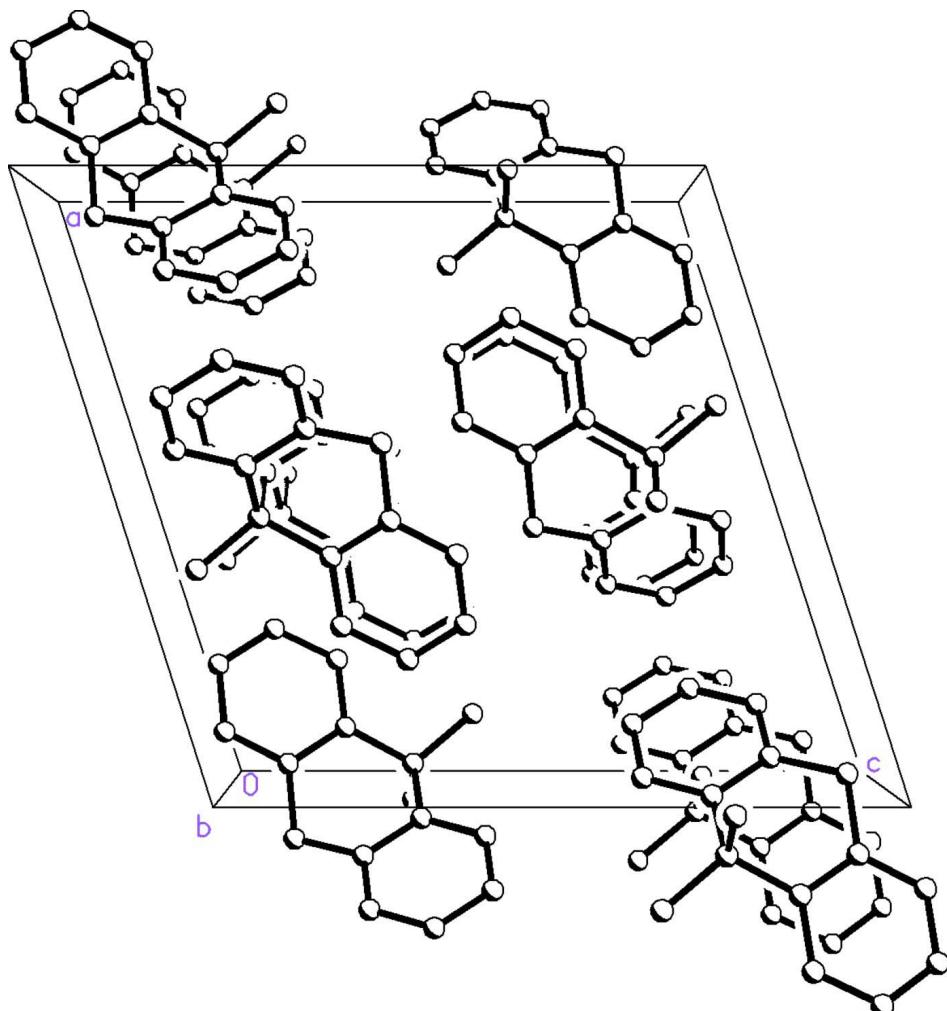

The title compound was obtained as a gift sample from R. L. Fine Chemicals, Bangalore. X-ray quality crystals were grown from toluene solution by slow evaporation (320–322 K).

### S3. Refinement

All of the H atoms were placed in their calculated positions and then refined using the riding model with C—H lengths of 0.95 Å (CH), 0.99 Å (CH) or 0.98 Å (CH<sub>3</sub>). The isotropic displacement parameters for these atoms were set to 1.19–1.20 (CH), 1.2 (CH<sub>2</sub>) or 1.49 (CH<sub>3</sub>) times  $U_{\text{eq}}$  of the parent atom.

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
