Correspondence e-mail: ruitaozhu@126.com

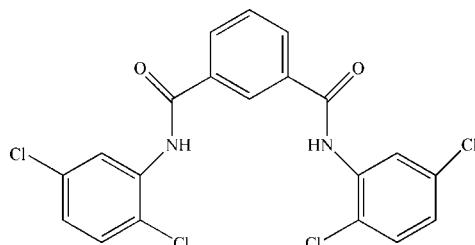

Received 19 July 2011; accepted 5 August 2011

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.042;  $wR$  factor = 0.110; data-to-parameter ratio = 13.2.

The asymmetric unit of the title compound,  $\text{C}_{20}\text{H}_{12}\text{Cl}_4\text{N}_2\text{O}_2$ , contains one half-molecule with a center of symmetry along a  $\text{C}\cdots\text{C}$  axis of the central benzene ring. The two  $\text{C}=\text{O}$  groups adopt an *anti* orientation and the two amide groups are twisted away from the central benzene ring by  $27.38(3)$  and  $27.62(4)^\circ$ . The mean planes of the dichloro-substituted benzene rings are twisted by  $7.95(4)^\circ$  with respect to the benzene ring. The crystal packing is stabilized by weak intermolecular  $\text{N}-\text{H}\cdots\text{O}$  interactions.

## N,N'-Bis(2,5-dichlorophenyl)isophthalamide

Ruitao Zhu, Jinlong Dong, Yu Zuo and Yuehong Ren

### S1. Comment

Anion recognition is an area of growing interest in supramolecular chemistry due to its important role in a wide range of environmental, clinical, chemical, and biological applications. Considerable attention has been focused on the design of artificial receptors that are able to selectively recognize and sense anion species (Gale, 2006). Artificial receptors, containing the isophthalamide core function as effective receptors for halide anions in very simple systems (Kavallieratos *et al.*, 1997, 1999; Light *et al.* 2006). We report here the crystal structure of the title compound, C<sub>20</sub>H<sub>12</sub>Cl<sub>4</sub>N<sub>2</sub>O<sub>2</sub>, (I), related to these types of receptors.

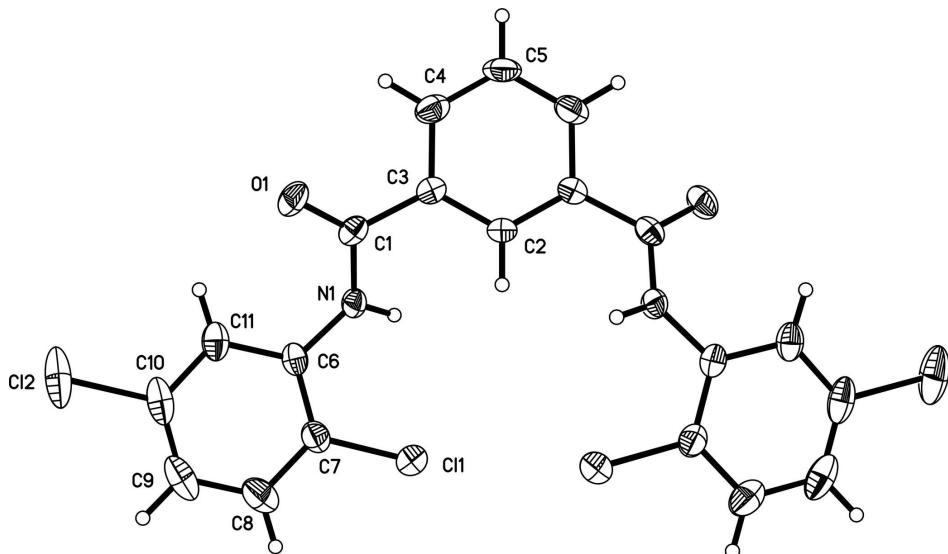

In the title compound, (I), the asymmetric unit containing one-half of the molecule crystallizes with a center of symmetry along the C2—C5 axis in the benzene ring thereby producing the desired structure (Fig. 1). In the molecule the two C=O groups adopt an *anti* orientation and the two amide groups are twisted away from the center benzene ring by 27.38 (3) ° and 27.62 (4) °, respectively. The mean planes of the dichloro substituted benzene rings are twisted by 7.95 (4) ° with that of the benzene ring. Bond lengths are in normal ranges (Allen *et al.*, 1987). Crystal packing is stabilized by weak N—H···O intermolecular interactions (Table 1).

### S2. Experimental

*N,N*-Bis(2,5-dichlorophenyl)isophthalamide (I) was prepared according to literature procedures (Kavallieratos *et al.*, 1997, 1999). To dichloromethane (20 ml) in a 100 ml flask was added 2,5-dichloroaniline (1.62 g, 10 mmol) with magnetic stirring. Isophthaloyl chloride (1.01 g, 5 mmol) was added gradually, and the reaction mixture was stirred at room temperature for 2 h and then poured into ice water (100 ml). The product was precipitated as a white powder, which was washed three times with water. Recrystallization from dimethyl sulfoxide solution produced the crystals of the title compound.

### S3. Refinement

H atoms were placed in idealized positions and allowed to ride on their respective parent atoms, with C—H = 0.93–0.96 Å, N—H = 0.86 Å and U<sub>iso</sub>(H) = 1.2U<sub>eq</sub>(C,N) or 1.5U<sub>eq</sub>(C<sub>methyl</sub>).

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
