Received 12 August 2011; accepted 1 September 2011

Key indicators: single-crystal X-ray study; $T = 295\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.041; wR factor = 0.116; data-to-parameter ratio = 22.2.

In the title compound, $\text{C}_{16}\text{H}_{13}\text{NO}_3\text{S}$, the sulfonyl-bound phenyl ring forms a dihedral angle of $84.17(6)^\circ$ with the indole ring system. An intramolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bond generates an *S*(6) ring motif. The crystal structure exhibits weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds and $\pi-\pi$ interactions between the five- and six-membered rings of the indole group [centroid–centroid distance = $3.6871(9)\text{ \AA}$].

2-Methyl-1-phenylsulfonyl-1*H*-indole-3-carbaldehyde

C. Ramathilagam, V. Saravanan, A. K. Mohanakrishnan, P. R. Umarani and V. Manivannan

S1. Comment

Indole derivatives are found in many natural products and these derivatives exhibit antibacterial, antifungal (Singh *et al.*, 2000) and antitumour activities (Andreani *et al.*, 2001). In addition, certain indole derivatives exhibit anti-hepatitis B virus (Chai *et al.*, 2006) activity.

The geometric parameters of the title molecule (Fig. 1) agree well with those observed in related structures (Chakkavarthi *et al.*, 2007, 2008; Ramathilagam *et al.*, 2011). The dihedral angle between the benzene (C1–C6) and phenyl rings (C11–C16) is 83.81 (7) $^{\circ}$. The sum of bond angles around N1 [359.9 $^{\circ}$] indicates sp^2 hybridization.

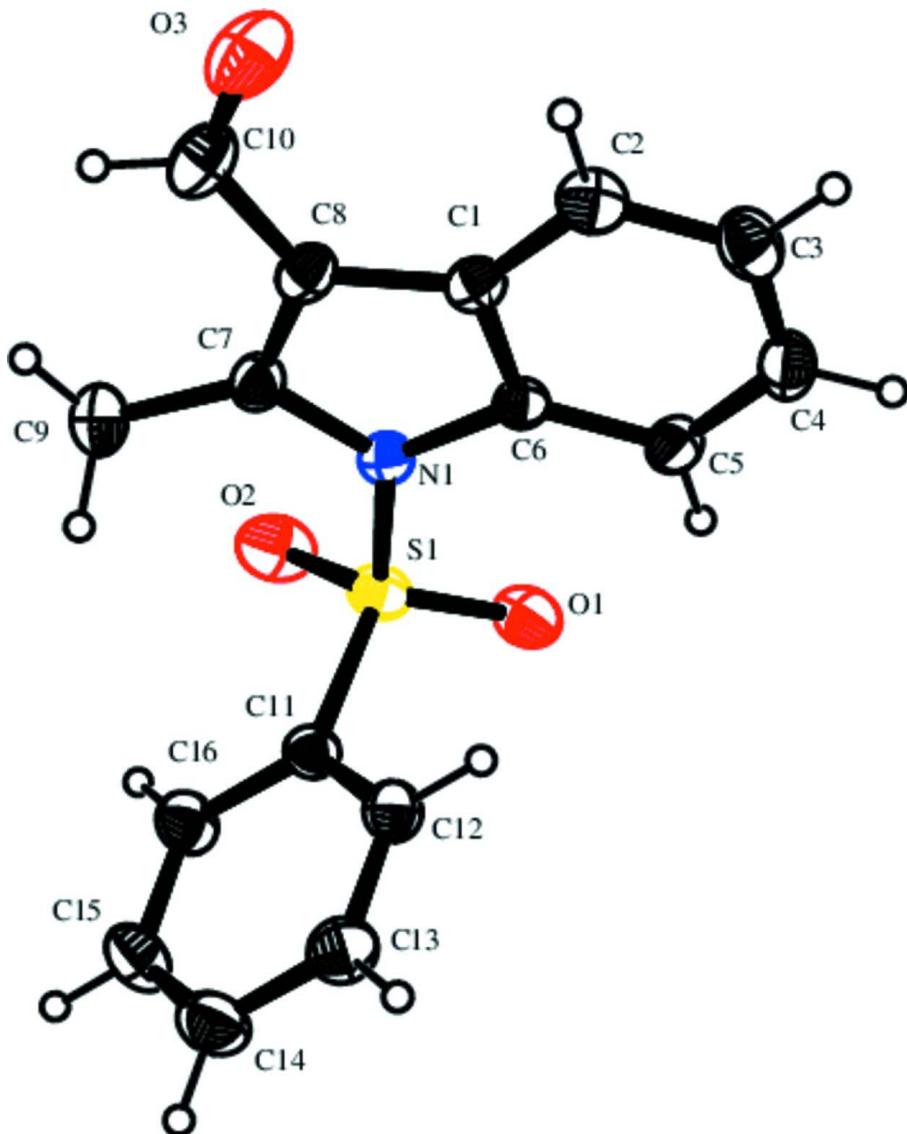

The molecular structure is stabilized by a weak intramolecular C—H…O hydrogen bond and the crystal packing is stabilized by weak intermolecular C—H…O hydrogen bonds. The intramolecular C5—H5…O1 hydrogen bond generates an S(6) ring (Bernstein *et al.*, 1995).

S2. Experimental

2-Methylindole-3-carboxaldehyde (5 g, 31.4 mmol) was dissolved in distilled benzene (100 ml). To this benzenesulfonylchloride (6.6 g, 4.8 ml, 37.7 mmol) and 60% aqueous NaOH (32 g in 53 ml) were added along with tetrabutyl ammonium hydrogensulfate (1.0 g). This two phase system was stirred at room temperature for 2 h. It was then diluted with water (200 ml) and the organic layer was separated. The aqueous layer was extracted with benzene (2 \times 30 ml) and the combined organic extracts were dried (Na_2SO_4). The solvent was removed completely and the crude product was recrystallized from methanol (m.p 431–433 K).

S3. Refinement

H atoms were positioned geometrically and refined using riding model, with $d(C-H) = 0.93 \text{ \AA}$ and $U_{iso}(H) = 1.2U_{eq}(C)$ for aromatic C—H and $d(C-H) = 0.96 \text{ \AA}$ and $U_{iso}(H) = 1.5U_{eq}(C)$ for methyl C—H.

 $\Delta\rho_{\min} = -0.27 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
