Received 30 September 2011; accepted 3 October 2011

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.054; wR factor = 0.134; data-to-parameter ratio = 16.7.

In the title amide compound, $\text{C}_{16}\text{H}_{17}\text{NO}_5$, the dihedral angle between the benzene rings is $71.59(4)^\circ$. In the crystal, intermolecular $\text{N}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds link the molecules into a two-dimensional array parallel to the ab plane.

N-(4-Hydroxyphenyl)-3,4,5-trimethoxybenzamide

Hyeong Choi, Yong Suk Shim, Byung Hee Han, Sung Kwon Kang and Chang Keun Sung

S1. Comment

Tyrosinase, a multi functional copper containing enzyme, is widely distributed in the plant and animal kingdom. It is responsible for catalyzing *ortho*-hydroxylation of phenols and *ortho*-phenol oxidation to corresponding quinones (Kubo *et al.*, 2000). This enzyme was not only responsible for the browning of fruits and vegetables but also caused some dermatological problems such as flecks and melasma due to overproduction of melanin (Nerya *et al.*, 2004). Numerous potential tyrosinase inhibitors have been discovered from natural and synthetic sources, such as a kojic acid (Cabanes *et al.*, 1994), arbutin (Casanola-Martin *et al.*, 2006) and phenylthiourea (Thanigaimalai *et al.*, 2010). But some of these inhibitors suffer from number of limitations, such as low activity and high toxicity. We have synthesized the title compound, (I), from the reaction of 3,4,5-trimethoxybenzoyl chloride and 4-aminophenol under ambient conditions. Herein, the crystal structure of (I) is described (Fig. 1).

The 3,4,5-trimethoxybenzoic acid moiety and 4-aminophenol group are essentially planar, with a mean deviation of 0.031 and 0.036 Å, respectively, from the corresponding least-squares plane defined by the ten and eight, respectively, constituent atoms. The dihedral angle between the benzene rings is 71.59 (4)°. The intermolecular N9—H9···O17ⁱ and O16—H16···O8ⁱⁱ [symmetry codes: (i) $-x + 1/2, y - 1/2, z$; (ii) $-x - 1/2, y - 1/2, z$; Table 1] hydrogen bonds allow to form an extensive two-dimensional network parallel to the *ab* plane (Fig. 2), which stabilizes the crystal structure.

S2. Experimental

The 3,4,5-trimethoxybenzoyl chloride and 4-aminophenol were purchased from Sigma Chemical Co. Solvents for organic synthesis were redistilled before use. All other chemicals and solvents were of analytical grade and were used without further purification. The title compound was prepared from the reaction of 3,4,5-trimethoxybenzoyl chloride (0.5 g, 1.0 mmol) and 4-aminophenol (0.4 g, 1.2 mmol) by simple substitution in THF (6 ml) with triethylamine (0.22 g, 1.2 mmol). The solvent was removed under reduced pressure. The mixture compound were purified by column chromatography on silica gel (2:1 dichloromethane/ethylacetate) to give the title compound (69%, m.p. 504 K). Colourless crystals of (I) were obtained from its ethanolic solution by slow evaporation of the solvent at room temperature.

S3. Refinement

Atoms H9 and H16 of the NH and OH groups were located in a difference Fourier map and refined freely [refined distances: N—H = 0.87 (2) Å and O—H = 0.88 (4) Å]. Other H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93 or 0.96 Å, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$ (carrier C) for aromatic or $1.5U_{\text{eq}}$ (carrier C) for methyl H atoms.

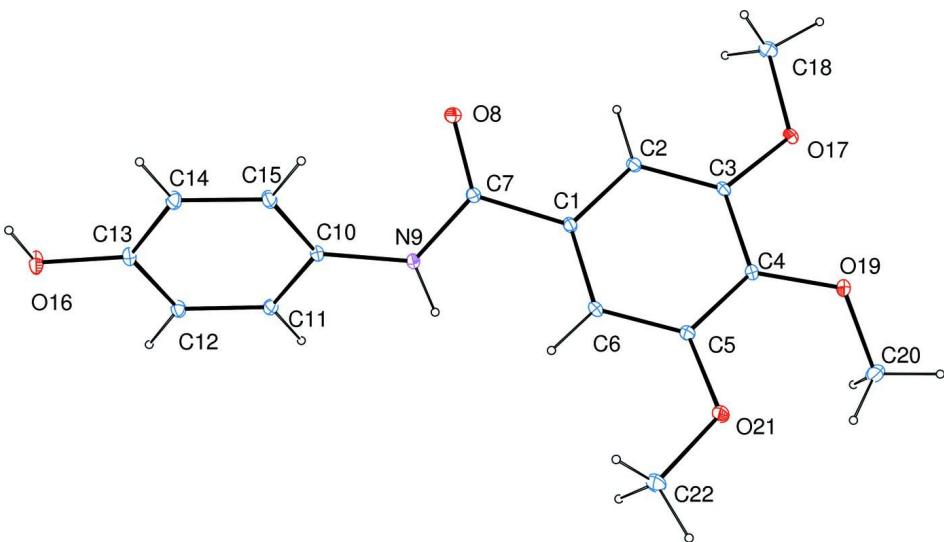

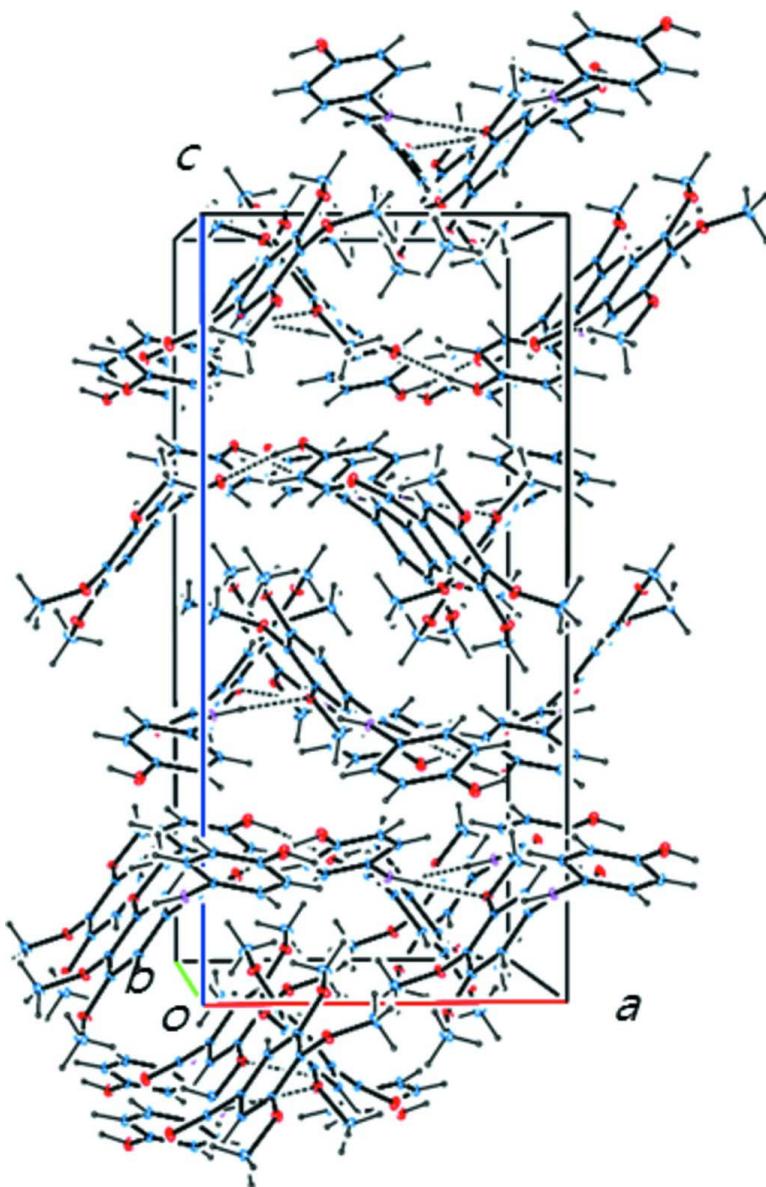

Figure 1

A molecular view of the title compound, showing the atom-numbering scheme and 30% probability ellipsoids.

**Figure 2**

A packing diagram of the title compound, showing a two-dimensional network of molecules linked by intermolecular N—H···O and O—H···O hydrogen bonds (dashed lines).

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
