Received 2 December 2011; accepted 7 December 2011

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.036; wR factor = 0.084; data-to-parameter ratio = 17.2.

The benzene and phenyl rings in the title compound, $\text{C}_{14}\text{H}_9\text{Cl}_3\text{N}_2\text{OS}$, form a dihedral angle of $40.98(6)^\circ$. The molecule exists in the thione form with typical thiourea C—S [1.666 (2) Å] and C—O [1.227 (3) Å] bond lengths as well as shortened C—N bonds [1.345 (3) and 1.386 (2) Å]. An intramolecular N—H···O hydrogen bond stabilizes the molecular conformation. In the crystal, pairs of N—H···S hydrogen bonds link the molecules into centrosymmetric dimers.

1-Benzoyl-3-(2,4,5-trichlorophenyl)thiourea

M. Khawar Rauf, Masahiro Ebihara, Amin Badshah and Imtiaz-ud-Din

S1. Comment

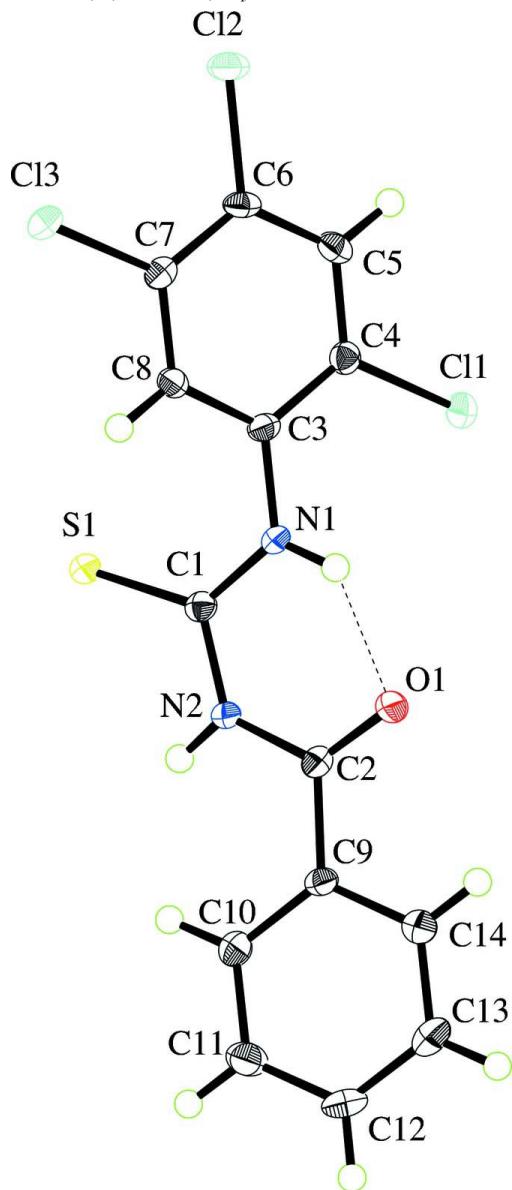

Thiourea derivatives are very useful building blocks for the synthesis of a wide range of aliphatic macromolecular and heterocyclic compounds. Thus, benzothiazoles have been prepared from arylthioureas in the presence of bromine (Patil & Chedekel, 1984), 2-aminothiazoles from the condensation of thiourea with α -halocarbonyl compounds (Baily *et al.*, 1996), and 2-Methyl-aminothiazolines from *N*-(2-hydroxyethyl)-*N'*-methylthioureas (Namgun *et al.*, 2001). *N,N*-dialkyl-*N*-arylothioureas have been efficiently used for the extraction of Nickel, Palladium and Platinum metals (Koch, 2001). Aliphatic and acylthioureas are well known for their antimicrobial activities (Wegner *et al.*, 1986). Symmetrical and unsymmetrical thioureas have shown antifungal activity against the plant pathogens (Krishnamurthy *et al.*, 1999). We became interested in the synthesis of these thioureas as intermediates in the synthesis of novel guanidines (Murtaza *et al.*, 2009a ; 2009b) and heterocyclic compounds for the systematic study of bioactivity and Complexation behaviour. Hence, we present here the crystal structure of the title compound, (I), Fig. 1. Comparison with *N*-benzoyl-*N'*-phenylthioureas [Cambridge Structural Database (*Mogul* Version 1.7; Allen, 2002) and (Allen *et al.*, 1987)], show the molecule to exist in the thione form with typical thiourea C—S and C—O bonds, as well as shortened C—N bond lengths. Comparison with *N*-benzoyl-*N'*-phenylthioureas (Khawar Rauf *et al.*, 2009a,b) suggests the 2,4,5-trichloro substitution on phenyl ring implies no significant effect on these bond lengths. Compound (I) (Fig. 1) shows the typical Thiourea C=S and C=O double bonds as well as shortened C—N bond lengths. The thiocarbonyl and carbonyl groups are almost coplanar, as reflected by the torsion angles C1—N2—C2—O1 [-5.0 (3)] and N1—C1—N2—C2 [1.7 (3)]. This is associated with the expected typical thiourea intramolecular N—H···O H-bond (Table 1), forming a six-membered ring commonly observed in this class of compounds (Khawar Rauf *et al.*, 2009a,b). The dihedral angles to the N1 C1 S1 N2 C2 O1 plane are 50.97 (4) $^{\circ}$ for the ring formed by C3 to C8 and 11.44 (7) $^{\circ}$ for the ring formed by C9 to C14. The crystal packing shows intramolecular N—H···O and intermolecular N—H···S H-bonds (Table 1, Fig. 2). The Cl atoms are not involved in any type of H-bonds.

S2. Experimental

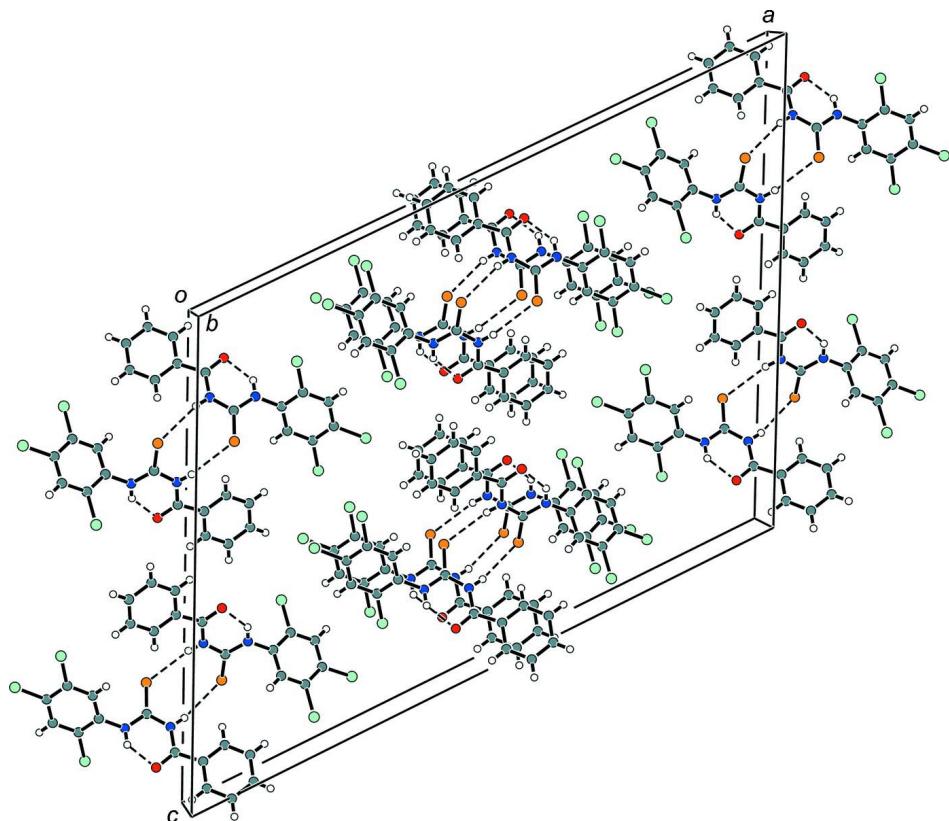

Freshly prepared benzoylisothiocyanate (1.63 g, 10 mmol) was dissolved in acetone (50 ml) and stirred for 45 minutes. Afterwards neat 2,4,5-trichloroaniline (1.96 g, 10 mmol) was added and the resulting mixture was stirred for 1 h. The reaction mixture was then poured into acidified water and stirred well. The solid product was separated and washed with deionized water and purified by recrystallization from methanol/1,1-dichloromethane (1:1 v/v) to give fine crystals of the title compound (I), with an overall yield of 95%. Full spectroscopic and physical characterization will be reported elsewhere.

S3. Refinement

Hydrogen atoms were included in calculated positions and refined as riding on their parent atom with N—H = 0.86 Å and $U_{\text{iso}}(\text{H}) = 1.2U(\text{N}_{\text{eq}})$, C—H = 0.93 Å and $U_{\text{iso}}(\text{H}) = 1.2U(\text{C}_{\text{eq}})$.

**Figure 1**

 $\Delta\rho_{\min} = -0.39 \text{ e } \text{\AA}^{-3}$

*Special details***Experimental.** ????

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
