Received 1 December 2011; accepted 5 December 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.041; wR factor = 0.111; data-to-parameter ratio = 17.3.

In the title compound, $\text{C}_{24}\text{H}_{19}\text{ClN}_2\text{O}_3\text{S}$, the sulfonyl-bound benzene ring forms dihedral angles of 38.1 (2) and 81.2 (1)°, respectively, with the formyl benzene and benzene rings. The molecular conformation is stabilized by a weak intramolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bond, which generates an *S*(5) ring motif. The crystal packing is stabilized by $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds, which generate *C*(7) zigzag chains along [010] and $R_3^2(19)$ ring motifs along [010]. The crystal packing is further stabilized by $\text{C}-\text{Cl}\cdots\pi$ interactions [$\text{Cl}\cdots\text{centroid} = 3.456\text{ (2) \AA}$ and $\text{C}-\text{Cl}\cdots\text{centroid} = 173.4\text{ (2) }^\circ$].

S1. Comment

Sulfonamide drugs are widely used for the treatment of certain infections caused by Gram-positive and Gram-negative microorganisms, some fungi, and certain protozoa (Korolkovas, 1988, Mandell & Sande, 1992). In view of this biological importance, the crystal structure of the title compound has been determined and the results are presented here.

Fig. 1 shows a displacement ellipsoid plot of (I), with the atom numbering scheme. The S1 atom shows a distorted tetrahedral geometry, with O2—S1—O3[119.8 (1) $^{\circ}$] and N1—S1—C8[107.5 (1) $^{\circ}$] angles deviating from ideal tetrahedral values. The sum of bond angles around N1 (352 $^{\circ}$) indicates that N1 is in sp^2 hybridization. The sulfonyl bound phenyl (C8—C13) ring forms dihedral angles of 38.1 (2) $^{\circ}$ and 81.2 (2) $^{\circ}$, respectively, with the formyl phenyl (C1—C6) and phenyl (C18—C23) rings. The dihedral angle between formyl phenyl and phenyl rings is 87.3 (1) $^{\circ}$. The C11 atom deviates from the plane of attached ring by -0.031 (2) Å. The carbonitrile side chain (C16—C24—N2) is almost linear, with the angle around central carbon atom being 176.9 (3) $^{\circ}$. The geometric parameters of the title molecule agrees well with those reported for similar structures (Ranjith *et al.*, 2009, Aziz-ur-Rehman *et al.*, 2010).

The molecular structure is stabilized by C15—H15A…O3 intramolecular hydrogen bond, forming S(5) ring motif (Bernstein *et al.*, 1995) (Table 1). The crystal packing is stabilized by intermolecular C—H…O hydrogen bonds. The formation of the framework can be explained in terms of two-one substructures. In the first substructure, atom C3 in the molecule at (x, y, z) acts as a hydrogen bond donor to atom O2 in the molecule at ($2-x, 1/2+y, 1/2-z$) generating C(7) zig zag chains which are running along [010] (Fig. 2). In the second substructure, three molecules are linked by the combination of C15—H15A…O2 and C23—H23…O1 intermolecular hydrogen bonds generating R₃³(19) ring motifs along [010] (Fig. 3). The crystal structure is further stabilized by C—Cl… π interactions involving chlorine Cl1 and benzene ring (C1—C6), with Cl1…centroid(Cgⁱ) distance of 3.456 (2) Å and C21—Cl1…Cgⁱ angle of 173.4 (2) $^{\circ}$ (Symmetry code as in Fig. 4). The crystal packing also exhibits π — π interactions with centroid—centroid distances: Cg2—Cg3ⁱⁱ = 3.884 (2) Å and Cg3—Cg2ⁱⁱⁱ = 3.884 (2) Å (Fig. 4; Cg2 and Cg3 are the centroids of C18—C23 benzene ring and C8—C13 benzene ring, respectively, symmetry code as in Fig. 4).

S2. Experimental

A solution of *N*-(formylphenyl)(4-methylbenzene)sulfonamide (1 mmol, 0.28 g) and potassium carbonate (1.5 mmol, 0.21 g) in acetonitrile solvent was stirred for 15 minutes at room temperature. To this solution, (*E*)-2-(bromo-methyl)-3-(4-chlorophenyl)prop-2-enenitrile (1.2 mmol, 0.30 g) was added dropwise till the addition is complete. After the completion of the reaction, as indicated by TLC, acetonitrile was evaporated. Ethylacetate (15 ml) and water (15 ml) were added to the crude mass. The organic layer was dried over anhydrous sodium sulfate. Removal of solvent led to the crude product, which was purified through pad of silica gel (100–200 mesh) using ethylacetate and hexanes (1:9) as solvents. The pure title compound was obtained as a colourless solid (0.41 g, 90 % yield). Recrystallization was carried

out using ethylacetate as solvent.

S3. Refinement

H atoms were positioned geometrically, with C—H = 0.93–0.98 Å and constrained to ride on their parent atom, with $U_{\text{iso}}(\text{H})=1.5U_{\text{eq}}$ for methyl H atoms and $1.2U_{\text{eq}}(\text{C})$ for other H atoms.

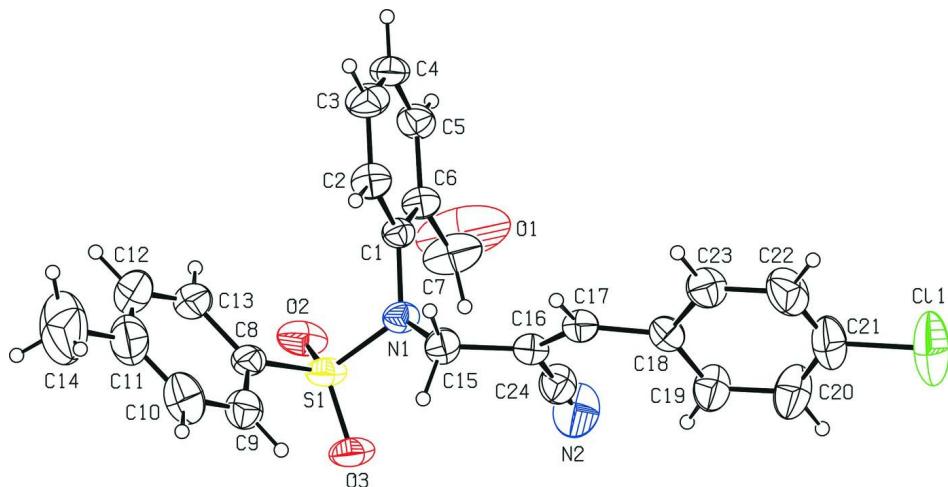

Figure 1

The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are presented as a small cycles of arbitrary radius.

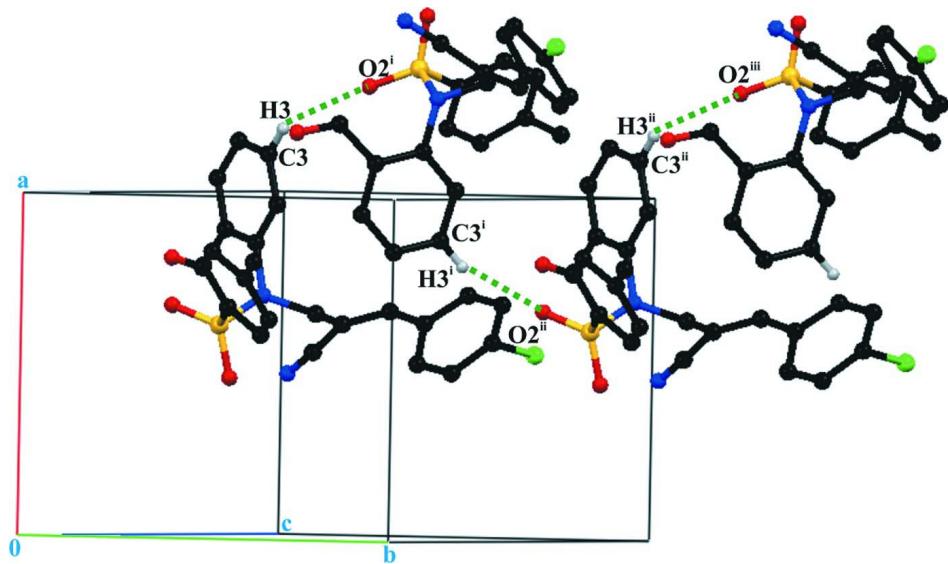

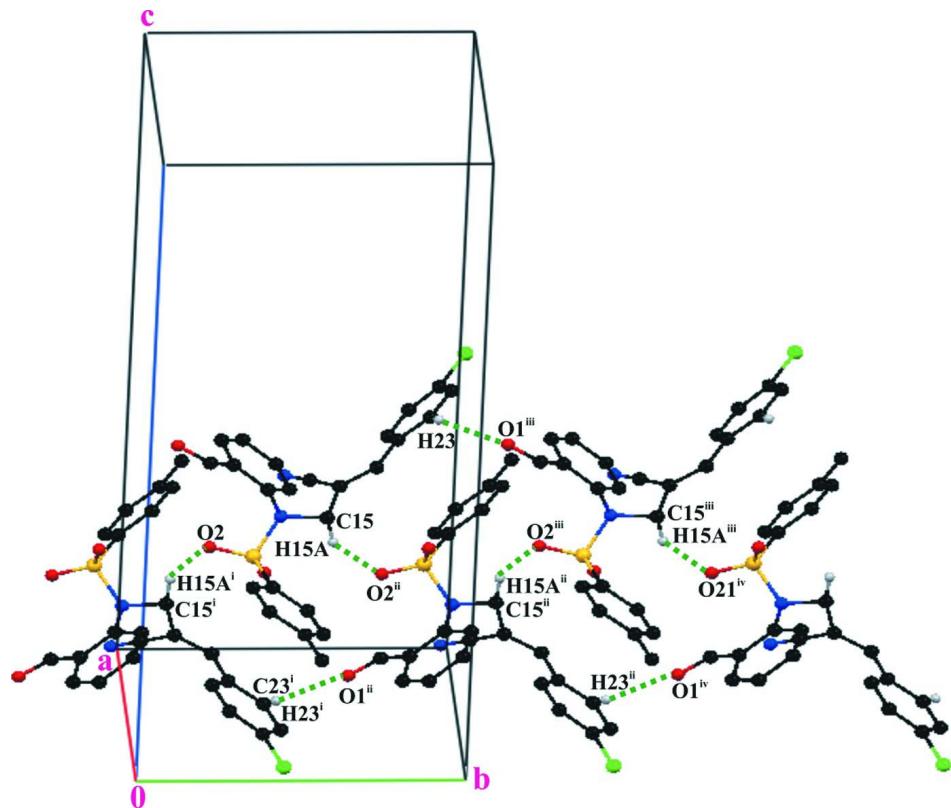

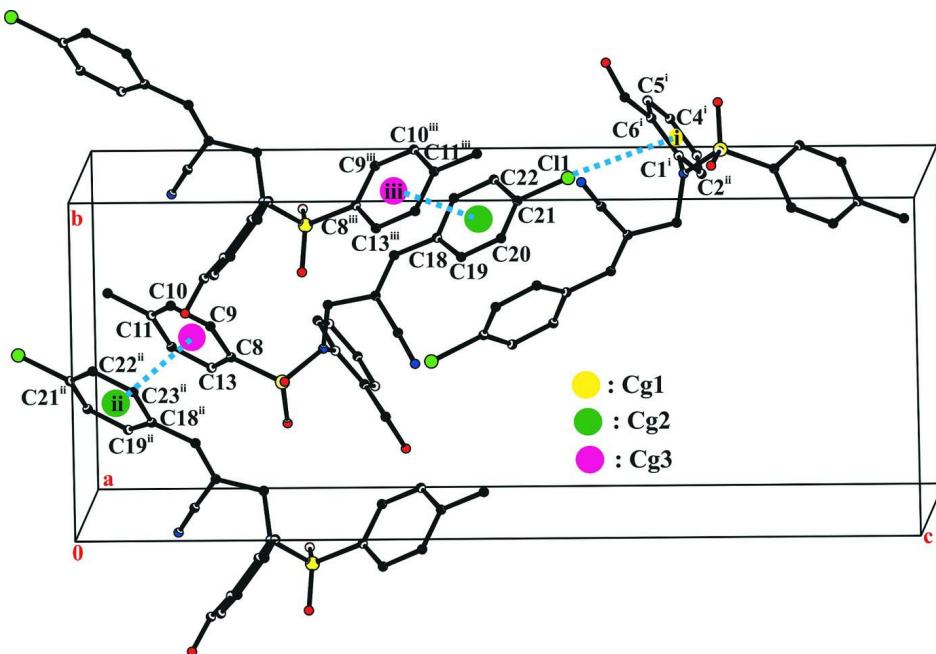

Figure 2

Part of the crystal structure of (I) showing C—H···O hydrogen bonds (dotted lines), with the formation of C(7) zig zag chains along [010]. [Symmetry codes: (i) $2-x, 1/2+y, 1/2-z$; (ii) $x, 1+y, z$; (iii) $2-x, 3/2+y, 1/2-z$].

**Figure 3**

Part of the crystal structure of (I) showing C—H···O hydrogen bonds (dotted lines), with the formation of $R_3^3(19)$ ring motifs along [010] [Symmetry codes: (i) $I-x, -1/2+y, 1/2-z$; (ii) $I-x, 1/2+y, 1/2-z$; (iii) $x, 1+y, z$; (iv) $I-x, 3/2+y, 1/2-z$].

**Figure 4**

A view of the C—Cl··· π and π ··· π interactions (dotted lines) in the crystal structure of the title compound. Cg1, Cg2 and Cg3 denotes centroids of the C1–C6 benzene ring, C8–C13 benzene ring and C18–C23 benzene ring, respectively. [Symmetry codes: (i)-1/2+x, 3/2-y, 1-z; (ii)1-x, -1/2+y, 1/2-z; (iii)1-x, 1/2+y, 1/2-z].

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
