### S1. Comment

Tetrahydroisoquinoline is a core structure in various natural and pharmaceutically active compounds, displaying a broad spectrum of activity. Molecules with a C<sub>1</sub>-symmetric tetrahydroisoquinoline backbone have been studied for various catalytic reactions such as allylic alkylation (Blanc *et al.*, 2003), Henry reactions (Kawthekar *et al.*, 2010), asymmetric hydrogenation reactions (Chakka *et al.*, 2010; Peters *et al.*, 2010) and Diels-Alder reactions (Naicker *et al.*, 2010). The title compound is one of the ligands used for asymmetric Henry reaction, its' catalytic activity is currently under investigation. The chiral carbon (C9) has been assigned an *S* configuration from two-dimensional NMR measurements.

In the title compound, the piperidine ring of the tetrahydroisoquinolinone unit adopts a half chair (Fig 1). This heterocyclic ring within similar structures displays either a half chair or half boat conformation (Naicker *et al.* 2011a; 2011b). From the crystal structure it is evident that the *N*-containing six membered ring assumes a half chair conformation [ $Q = 0.483$  (2) Å,  $\theta = 50.1$  (2)° and  $\varphi = 321.8$  (3)°]. The torsion angle for C1—N1—C9—C10 is -171.72 (14)°. From the plain formed by the atoms C1—C2—C7—C8—C9—N1 the maximum displacement from planarity for N1 is 0.297 Å and for C9 0.331 Å (Fig. 1). This is similar to our previously reported structures which also assume half chair conformations (Naicker *et al.*, 2011a; 2011b). The crystal packing contains C—H···N contacts of distance 3.341 (3) Å (see Fig. 2) (Table 1). There is no  $\pi$ – $\pi$  stacking within the crystal structure.

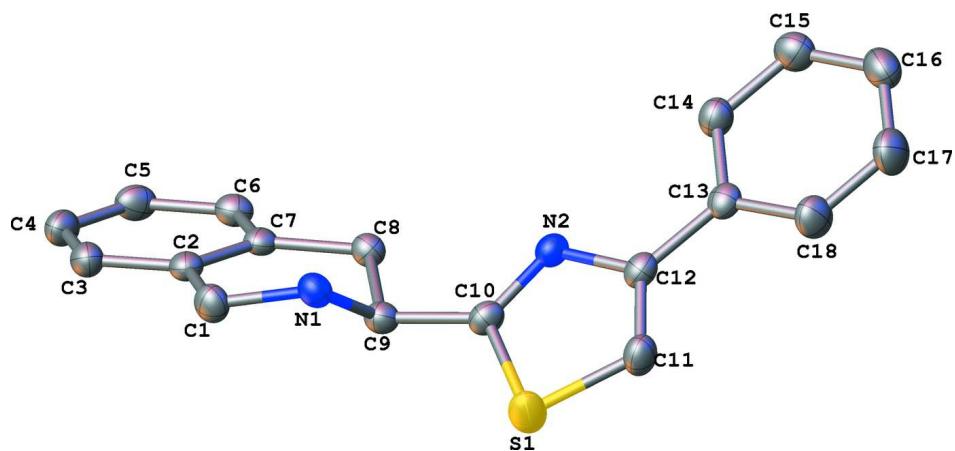

### S2. Experimental

The *N*-protected thiazole (3 mmol) was dissolved in THF (15 ml), to this 12 *M* HCl (15 ml) was added slowly and the reaction mixture was stirred at room temperature for 2 h. THF was evaporated under vacuum. The reaction was monitored by TLC using EtOAc/Hexane (20:80,  $R_f = 0.5$ ). The reaction mixture was slowly poured into aqueous saturated NaHCO<sub>3</sub> solution, the mixture was then extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 x 30 ml). The combined organic layer was dried over MgSO<sub>4</sub>. The solvent was evaporated under reduced pressure, the residue was purified by column chromatography on silica gel (deactivated with 5% Et<sub>3</sub>N) with Et<sub>3</sub>N/EtOAc/Hexane (5/8/100) as the eluent to afford the thiazole as a yellow solid (0.27 g, yield 95%). *M.p.* = 357–360 K.

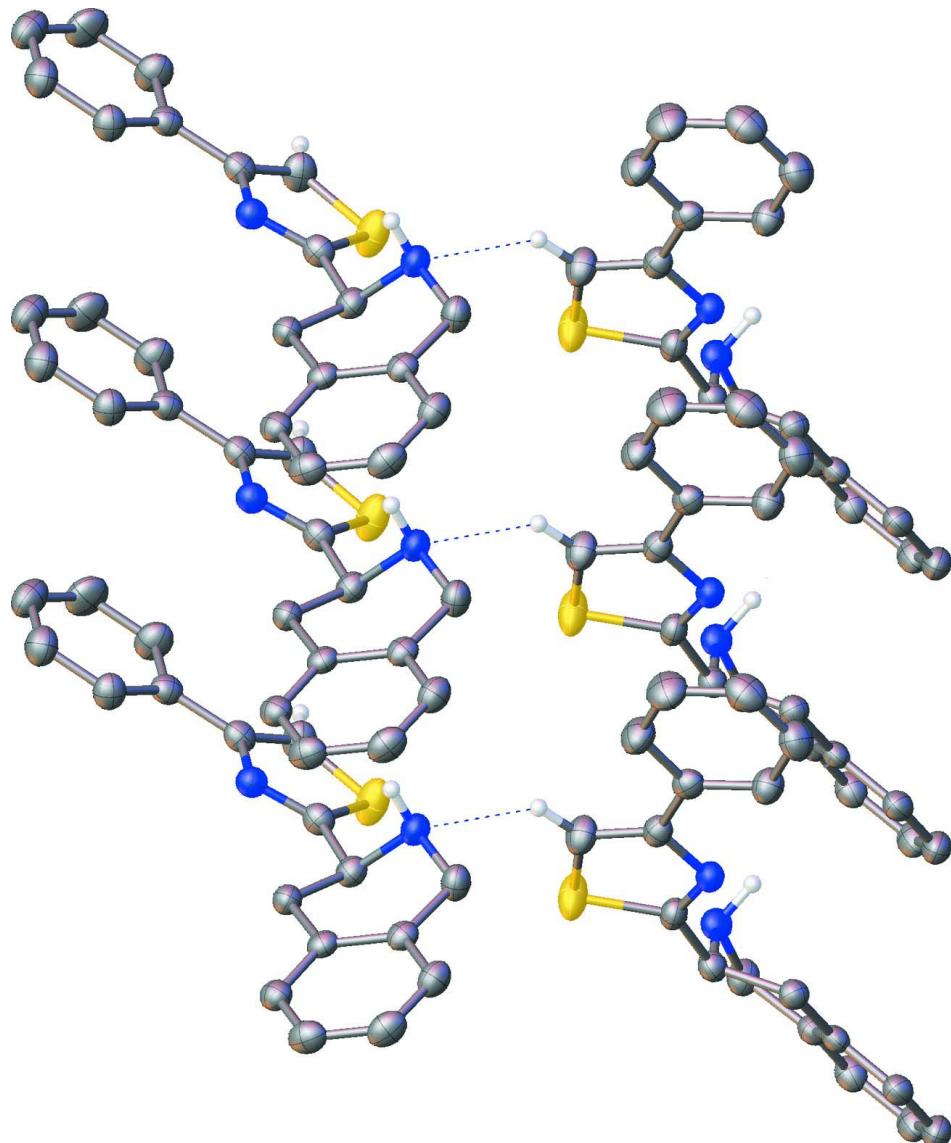

Recrystallization from tetrahydrofuran at room temperature afforded colourless crystals suitable for X-ray analysis.

### S3. Refinement

All non-hydrogen atoms were refined anisotropically. All hydrogen atoms, except H1N, were positioned geometrically with C—H distances ranging from 0.95 Å to 1.00 Å and refined as riding on their parent atoms with  $U_{\text{iso}}$  (H) = 1.2 - 1.5  $U_{\text{eq}}$  (C).

**Figure 1**

The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 40% probability level. The hydrogen atoms have been omitted for clarity.

*Special details*

**Experimental.** Half sphere of data collected using the Bruker *SAINT* software package. Crystal to detector distance = 30 mm; combination of  $\varphi$  and  $\omega$  scans of  $0.5^\circ$ , 60 s per  $^\circ$ , 2 iterations.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
