## 2-Ethyl 4-methyl 5-ethyl-3-methyl-1*H*-pyrrole-2,4-dicarboxylate

Gui-Fen Lu,\* Min Zhu, Wei-Hua Zhu and Zhong-Ping Ou

School of Chemistry and Chemical Engineering, Jiangsu University, Zhenjiang 212013, People's Republic of China

Correspondence e-mail: luguifen8012@yahoo.com.cn

Received 6 January 2012; accepted 14 January 2012

 Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.067;  $wR$  factor = 0.220; data-to-parameter ratio = 14.2.

The title pyrrole derivative compound,  $\text{C}_{12}\text{H}_{17}\text{NO}_4$ , was synthesized from methyl 3-oxopentanoate by a Knorr-type reaction and contains a pyrrole ring to which two diagonal alkoxy-carbonyl groups and two diagonal alkyl substituents are attached. The methylcarbonyl and ethylcarbonyl substituents are approximately co-planar with the pyrrole ring, making dihedral angles of  $5.64$  (2) and  $3.44$  (1)°, respectively. In the crystal, adjacent molecules are assembled by pairs of  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds into dimers in a head-to-head mode.

## 2-Ethyl 4-methyl 5-ethyl-3-methyl-1*H*-pyrrole-2,4-dicarboxylate

Gui-Fen Lu, Min Zhu, Wei-Hua Zhu and Zhong-Ping Ou

### S1. Comment

Polysubstituted pyrroles have been paid much attention because of their wide application in the preparation of porphyrins (Trofimov *et al.*, 2004), corroles (Guilard *et al.*, 2001) and as monomers for polymer chemistry (Brockmann & Tour, 1995; Paixão *et al.*, 2003). In view of the importance of the 2-(alkoxycarbonyl)pyrrole derivatives (Fan *et al.*, 2008; Lu *et al.*, 2011; Takaya *et al.*, 2001), the title compound was synthesized and characterized by X-ray diffraction.

As shown in Fig. 1, the compound has a five-membered pyrrole ring as skeleton and four substituents. The methoxycarbonyl and ethoxycarbonyl groups are located on two diagonal carbon atoms of the pyrrole skeleton, which is also true for the methyl and ethyl substituents, forming an asymmetrical molecule. Adjacent molecules are assembled in a head to head mode by hydrogen bonding between the donor atom N<sub>1</sub> and acceptor atom O<sub>1</sub> (symmetry code:  $-x, 1 - y, -z$ ) (Table 1, Fig. 2). The bond distances are in the normal range of the similar species reported by Yamamoto *et al.* (1986).

### S2. Experimental

The title compound was synthesized from ethyl acetoacetate and methyl 3-oxopentanoate through oximation, Claisen condensation and reductive condensation according to the method reported by Ou *et al.* (2009). Single crystals suitable for X-ray measurements were grown from ethanol by slowly evaporation at room temperature.

### S3. Refinement

All the non-hydrogen atoms were refined anisotropically by full-matrix least-squares calculations on F<sup>2</sup>. All H atoms (except H1a) were placed in geometrically idealized positions and treated as riding on their parent atoms with C—H = 0.97 Å,  $U_{\text{iso}} = 1.2U_{\text{eq}}$  (C) for methylene atoms and C—H = 0.96 Å,  $U_{\text{iso}} = 1.5U_{\text{eq}}$  (C) for methyl atoms. The H1a atom has located in a difference map and refined with  $U_{\text{iso}} = 1.5U_{\text{eq}}$  (N). The command 'DFIX' has been used to restrain the distance of H1a—N1 = 0.83 Å.

## Crystal data

$C_{12}H_{17}NO_4$	$Z = 2$
$M_r = 239.27$	$F(000) = 256$
Triclinic, $P\bar{1}$	$D_x = 1.235 \text{ Mg m}^{-3}$
Hall symbol: $-P\ 1$	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
$a = 7.2827 (10) \text{ \AA}$	Cell parameters from 1663 reflections
$b = 8.8573 (12) \text{ \AA}$	$\theta = 2.4\text{--}26.8^\circ$
$c = 11.1806 (16) \text{ \AA}$	$\mu = 0.09 \text{ mm}^{-1}$
$\alpha = 77.948 (2)^\circ$	$T = 293 \text{ K}$
$\beta = 73.135 (2)^\circ$	Sheet, colorless
$\gamma = 69.970 (2)^\circ$	$0.15 \times 0.12 \times 0.06 \text{ mm}$
$V = 643.62 (15) \text{ \AA}^3$	

## Data collection

Bruker APEXII CCD area-detector	3249 measured reflections
diffractometer	2255 independent reflections
Radiation source: fine-focus sealed tube	1891 reflections with $I > 2\sigma(I)$
Graphite monochromator	$R_{\text{int}} = 0.018$
$\varphi$ and $\omega$ scans	$\theta_{\text{max}} = 25.0^\circ$ , $\theta_{\text{min}} = 2.9^\circ$
Absorption correction: multi-scan	$h = -8 \rightarrow 6$
( <i>SADABS</i> ; Sheldrick, 2003)	$k = -10 \rightarrow 9$
$T_{\text{min}} = 0.986$ , $T_{\text{max}} = 0.995$	$l = -13 \rightarrow 13$

## Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H atoms treated by a mixture of independent and constrained refinement
$R[F^2 > 2\sigma(F^2)] = 0.067$	$w = 1/[\sigma^2(F_o^2) + (0.1366P)^2 + 0.1514P]$
$wR(F^2) = 0.220$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.11$	$(\Delta/\sigma)_{\text{max}} < 0.001$
2255 reflections	$\Delta\rho_{\text{max}} = 0.51 \text{ e \AA}^{-3}$
159 parameters	$\Delta\rho_{\text{min}} = -0.36 \text{ e \AA}^{-3}$
1 restraint	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kFc[1 + 0.001x\text{Fc}^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.046 (17)
Secondary atom site location: difference Fourier map	

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
