Received 8 January 2012; accepted 2 February 2012

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{N}-\text{C}) = 0.005$ Å; R factor = 0.043; wR factor = 0.081; data-to-parameter ratio = 16.7.

The structure of the polymeric title compound, $[\text{CuCl}(\text{CH}_4\text{N}_2\text{S})_2]_n$, has been redetermined to modern standards of precision with anisotropic refinement and location of the H atoms. The previous structure report [Spofford & Amma (1970). *Acta Cryst.* **B26**, 1474–1483] is generally confirmed to higher precision [typical Cu–S bond length s.u. values = 0.005 (old) and 0.001 Å (new)]. The asymmetric unit contains two formula units, with both Cu^{I} atoms coordinated by one terminal S atom and two bridging S atoms of thiourea ligands. This connectivity leads to polymeric [100] chains in the crystal. If very long contacts to nearby chloride ions [2.8687 (9) and 3.1394 (12) Å] are considered to be bonding, then very distorted CuS_3Cl tetrahedral coordination polyhedra arise. The crystal structure is consolidated by weak intra- and inter-chain $\text{N}-\text{H}\cdots\text{S}$ and $\text{N}-\text{H}\cdots\text{Cl}$ hydrogen bonds.

Redetermination of *catena*-poly[[chlorido(thiourea- κ S)copper(I)]- μ -thiourea- κ^2 S:S] at 100 K

Hafid Zouihri

S1. Comment

In a former paper, we reported the crystal structure of (Diaminomethylidene)sulfonium chloride-thiourea (3/2) [Zouihri, 2012]. In this paper, we report the synthesis and the structure of the title compound. It was previously described by Spofford & Amma (1970).

The asymmetric unit of the title compound is shown in Fig. 1. The Cu^I ions have distorted tetrahedral coordination geometries formed by two bridging thiourea ligands, one terminal thiourea ligand and one chloride ion (Cu—S and Cu—Cl distances in the range of 2.2618 (10) Å to 3.1392 (12) Å) generating parallel one-dimensional polymeric chains propagating in the *a* axis direction.

In the crystal structure, there are two different types of hydrogen bonds (Table 1, Fig. 2). Intra-chain N—H \cdots S and N—H \cdots Cl interactions appear to influence the conformation of the helical chains while inter-chain N—H \cdots S and N—H \cdots Cl interactions crosslink the chains.

S2. Experimental

2 mmol of CuCl₂ and 1 mmol of (Diaminomethylidene)sulfonium chloride-thiourea (3/2) [Zouihri, 2012] in 5 ml of ethanol were refluxed for 1 h, forming a colorless solution. The solution was allowed to evaporate slowly and colourless prisms were obtained after several days.

S3. Refinement

All H atoms were located from difference Fourier maps and refined isotropically, with restrained distance N—H = 0.86 (2) Å.

**Figure 1**

Molecular view of the title compound showing displacement ellipsoids drawn at the 50% probability level.

**Figure 2**

Projection of the title compound along the *a* axis, H-bonds are represented by dashed lines.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.043$	All H-atom parameters refined
$wR(F^2) = 0.081$	$w = 1/[\sigma^2(F_o^2) + (0.0226P)^2 + 3.6977P]$
$S = 1.15$	where $P = (F_o^2 + 2F_c^2)/3$
4089 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
245 parameters	$\Delta\rho_{\text{max}} = 0.58 \text{ e } \text{\AA}^{-3}$
16 restraints	$\Delta\rho_{\text{min}} = -0.85 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
