The asymmetric unit of the title compound, $C_{16}H_{14}N_4O_4$, contains one half-molecule of (nitrophenyl)ethanimine and the complete molecule is generated by a crystallographic inversion centre. The molecule has an E conformation with respect to each C=N double bond. The central C=N—N=C plane is twisted from the benzene rings with a dihedral angle of 24.76 (11)°. In the crystal, C—H···O interactions link the molecules to form sheets that lie parallel to (10$\bar{4}$).

supporting information

(1*E*,2*E*)-1,2-Bis[1-(3-nitrophenyl)ethylidene]hydrazine

Safra Izuani Jama Asik, Hoong-Kun Fun, Ibrahim Abdul Razak, Patcharaporn Jansrisewangwong and Suchada Chantraproma

S1. Comment

Hydrazones have been intensively investigated mostly because of their potential applications as antibacterial and antifungal drugs (Khanmohammadi *et al.*, 2008) and as fluorescent chemosensors for metal ions (Luboch *et al.*, 2009). Owing to our medicinal chemistry research on hydrazones, we previously reported the synthesis and crystal structures of some hydrazone derivatives (Chantrapromma *et al.*, 2011; Fun, Jansrisewangwong *et al.*, 2011; Fun, Nilwanna *et al.*, 2011; Jansrisewangwong *et al.*, 2010; Nilwanna *et al.*, 2011). The title compound was synthesized to study for antibacterial activity and fluorescence properties in order to get more detail on the structural activity relationship through comparing with other closely related compounds.

The asymmetric unit of (I) (Fig. 1), contains one half-molecule of (nitrophenyl)ethanimine and the complete molecule is generated by a crystallographic inversion centre (-x,-y + 1,-z). The molecule is in an *E* configuration with respect to C7═N1 double bond [1.2803 (17) Å] with the torsion angle N1A—N1—C7—C1 = 179.92 (10)°. The methyl groups are twisted from the planes of benzene (C1–C6 and C1A–C6A) rings and their orientations can be indicated by the torsion angles (C1—C6—C7—C8 and C1A—C6A—C7A—C8A) = 24.91 (19)°. The bond length are within the normal range (Allen *et al.*, 1987) and are comparable with the related structures (Chantrapromma *et al.*, 2011; Fun, Jansrisewangwong *et al.*, 2011; Fun, Nilwanna *et al.*, 2011; Jansrisewangwong *et al.*, 2010; Nilwanna *et al.*, 2011). In the crystal structure (Fig. 2), the C3—H3A⋯O1 interaction links the molecules into two-dimensional layers parallel to the (1 0 $\overline{4}$) plane.

S2. Experimental

The title compound was synthesized by mixing a solution (1:2 molar ratio) of hydrazine hydrate (0.10 ml, 2 mmol) and 3-nitroacetophenone (0.66 g, 4 mmol) in ethanol (20 ml). The resulting solution was refluxed for 4 h, yielding the yellow crystalline solid. The resultant solid was filtered off and washed with methanol. Yellow block-shaped single crystals of the title compound suitable for X-ray structure determination were recrystalized from acetone by slow evaporation of the solvent at room temperature over several days (m.p. 469–471 K).

S3. Refinement

All the H atoms were positioned geometrically and refined using a riding model with C—H = 0.93 and 0.96 Å. The U_{iso} values were constrained to be $1.5U_{eq}$ of the carrier atom for methyl H atoms and $1.2U_{eq}$ for the remaining H atoms. A rotating group model was used for the methyl groups.
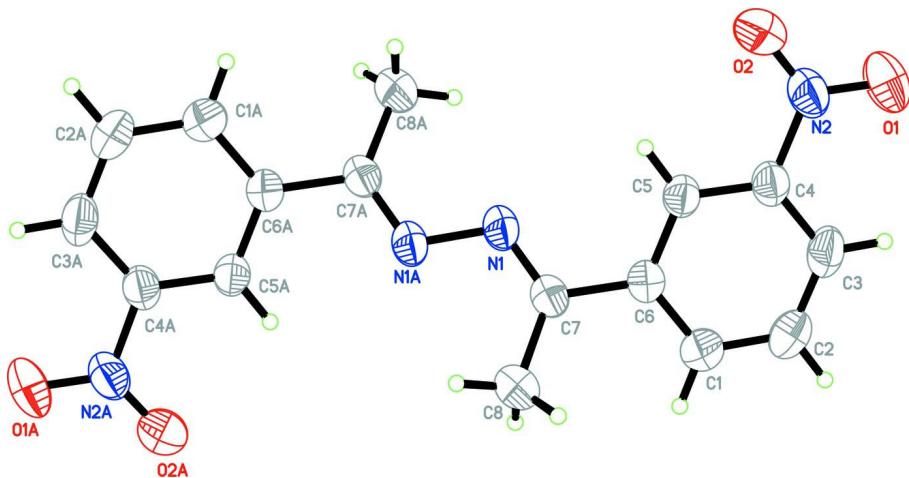

Figure 1

The structure of the title compound, showing 50% probability displacement ellipsoids. H atoms are shown as spheres of arbitrary radius.
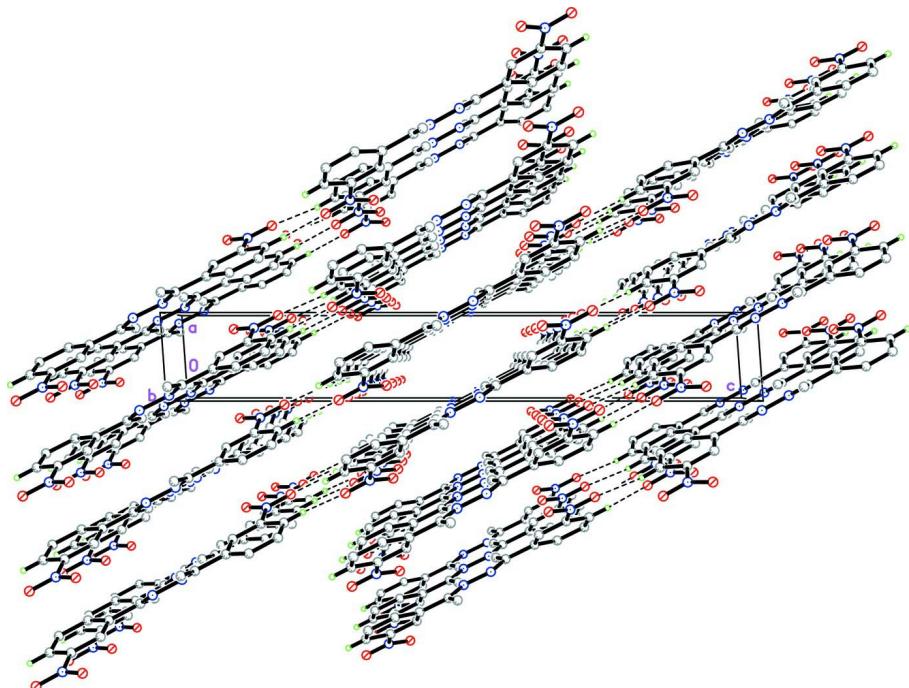

Figure 2

The crystal packing, viewed along the *b*-axis, showing the molecules linked into two-dimensional layers parallel to the (10$\bar{4}$) plane. H atoms that not involved in hydrogen bonding (dashed lines) are omitted for clarity.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F² against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F², conventional R-factors R are based on F, with F set to zero for negative F². The threshold expression of F² > 2sigma(F²) is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F² are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
