

**Dicyclohexyl(4-isopropylphenyl)-phosphane selenide****Sizwe Makhoba, Alfred Muller\* and Zanele Phasha**

Research Center for Synthesis and Catalysis, Department of Chemistry, University of Johannesburg, PO Box 524, Auckland Park, Johannesburg 2006, South Africa

Correspondence e-mail: mullera@uj.ac.za

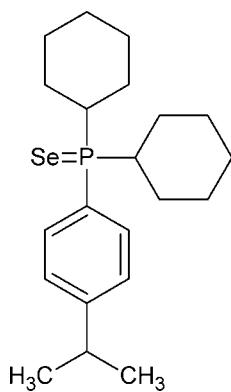

Received 25 January 2012; accepted 3 February 2012

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.023;  $wR$  factor = 0.057; data-to-parameter ratio = 24.5.

In the title compound,  $\text{C}_{21}\text{H}_{33}\text{PSe}$ , the  $\text{Se}=\text{P}$  bond is part of a distorted tetrahedral environment on the  $\text{P}$  atom. Both cyclohexyl groups adopt chair conformations. A cone angle of  $170^\circ$  was calculated using an adaptation of the Tolman model. Intermolecular  $\text{C}-\text{H}\cdots\text{Se}$  and  $\text{C}-\text{H}\cdots\text{Cg}$  contacts are observed ( $\text{Cg}$  is the centroid of the benzene ring).

## Dicyclohexyl(4-isopropylphenyl)phosphane selenide

Sizwe Makhoba, Alfred Muller and Zanele Phasha

### S1. Comment

The bonding of phosphorus to transitional metals have been investigated extensively, with several attempts to divide the properties of the phosphorus ligand into steric and electronic effects. Various techniques such as single-crystal X-ray crystallography, multi nuclear NMR and IR (Roodt *et al.*, 2003) have been used to this extent. Recently we have also included selenium derivatives of the phosphorus compounds into this study (Muller *et al.*, 2008). This route seems viable as the use of expensive transition metals and steric influence from other ligands in the coordination sphere are eliminated, leaving only crystal packing effects as an additional influence on the steric property of the phosphorus ligand. As part of this investigation we report here the selenium derivative of  $\text{PCy}_2(4\text{-}i\text{-Pr}\text{—C}_6\text{H}_4)$  where Cy = cyclohexyl and  $i\text{Pr}$  = iso-propyl.

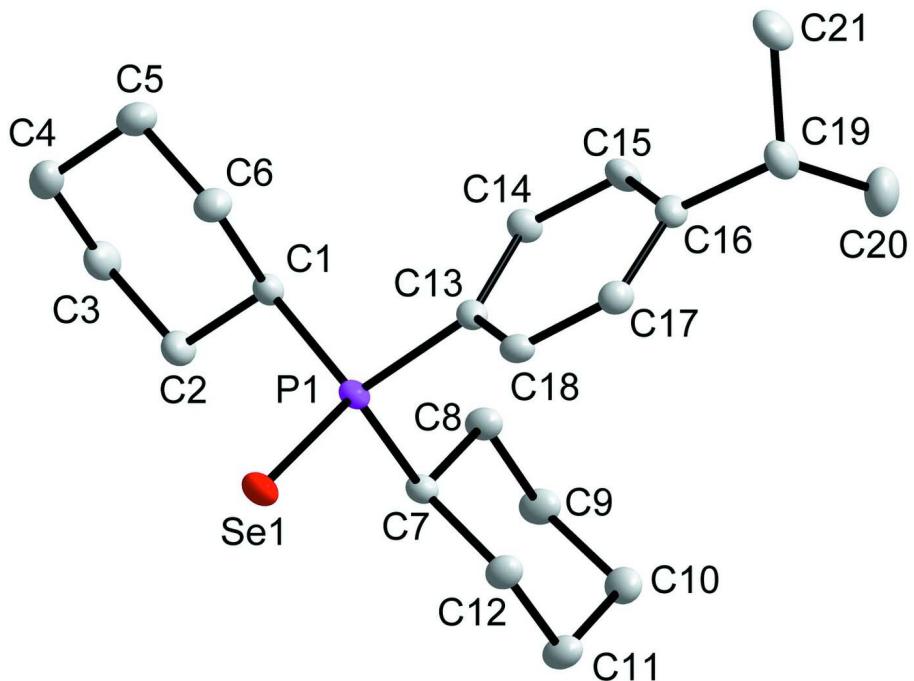

Molecules of the title compound (Fig. 1) adopts a distorted tetrahedral arrangement about the P atom with average C—P—C and Se—P—C angles of  $106.0^\circ$  and  $112.7^\circ$  respectively. The cone angle was found to be  $170^\circ$  when the Se—P distance was adjusted to  $2.28 \text{ \AA}$  (the default value from Tolman, 1977). This value is *ca*  $5^\circ$  larger than previous reported values where the present phosphine was bonded to a transition metal centre (Makhoba *et al.*, 2011; Vuba & Muller, 2012). This indicates to some extend the flexibility of this phosphine ligand and its ability to use space to enable less crowding of its substituents. Weak intermolecular C—H···Se and C—H···Cg contacts are observed (Table 1, Fig. 2) and link the molecules as infinite chains in the [001] direction.

### S2. Experimental

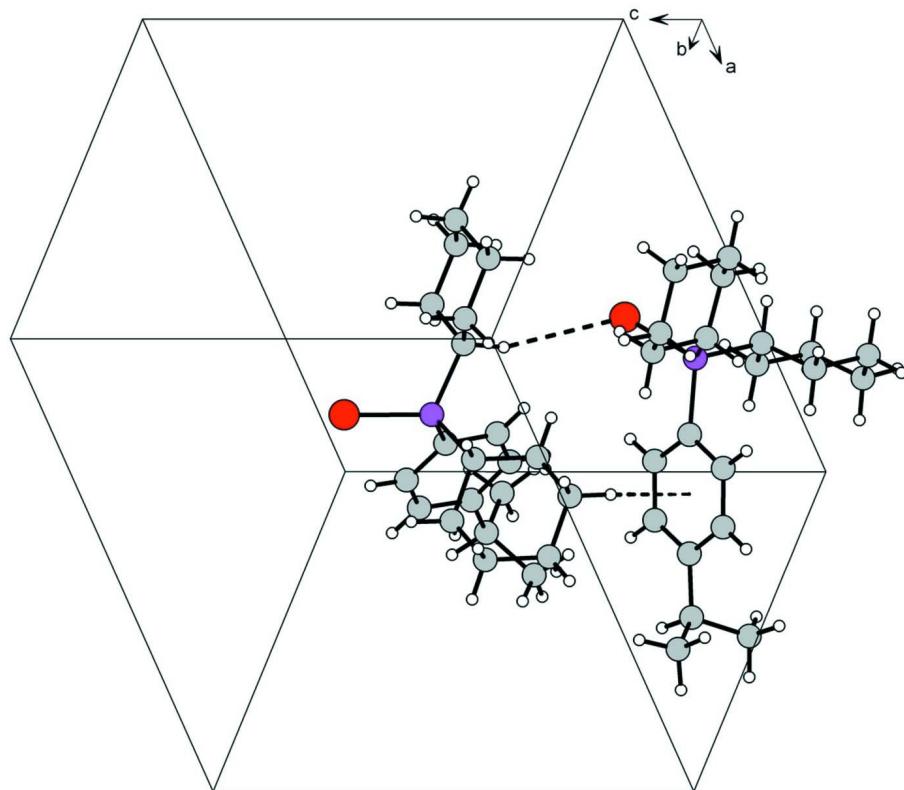

KSeCN (10 mg, 0.0694 mmol) and  $\text{PCy}_2(4\text{-}i\text{-Pr}\text{—C}_6\text{H}_4)$  (21.96 mg, 0.0694 mmol) were both dissolved in a minimum amount of methanol (10–20 ml). The KSeCN solution was added drop wise (5 min) to the phosphine solution while stirring at room temperature. The final solution was left to evaporate slowly in order to give crystals that are suitable for single-crystal X-ray study.

### S3. Refinement

All H atoms were positioned in geometrically idealised positions with C—H =  $1.00 \text{ \AA}$ ,  $0.99 \text{ \AA}$ ,  $0.98 \text{ \AA}$  and  $0.95 \text{ \AA}$  for methine, methylene, methyl and aromatic H atoms respectively and constrained to ride on their parents atoms with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$ , except for methyl where  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}$  was utilized. The initial positions of methyl H atoms were located from a Fourier difference map and refined as fixed rotor. The highest residual electron density of  $0.41 \text{ e \AA}^{-3}$  was located  $0.76 \text{ \AA}$  from C19, and the deepest hole of  $-0.24 \text{ e \AA}^{-3}$  is  $0.81 \text{ \AA}$  from P1. Both represent no physical meaning.

**Figure 1**

A view of the title compound showing the numbering scheme of atoms and displacement ellipsoids (drawn at the 50% probability level). H atoms omitted for clarity.

**Figure 2**

Packing diagram showing the interactions observed for the structure.

 Primary atom site location: structure-invariant direct methods

Secondary atom site location: difference Fourier map  
 Hydrogen site location: inferred from neighbouring sites  
 H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.0262P)^2 + 0.6415P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.41 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.24 \text{ e } \text{\AA}^{-3}$

*Special details*

**Experimental.** The intensity data was collected on a Bruker Apex DUO 4K CCD diffractometer using an exposure time of 10 s/frame. A total of 5967 frames were collected with a frame width of  $0.5^\circ$  covering up to  $\theta = 28.31^\circ$  with 100% completeness accomplished.

Analytical data:  $^{31}\text{P}$  {H} NMR ( $\text{CDCl}_3$ , 160 MHz):  $\delta = 54.1$  (s, 1P)

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg1 is the centroid of the C13—C18 benzene ring.

D—H···A	D—H	H···A	D···A	D—H···A
C1—H1···Se1 <sup>i</sup>	1.00	3.09	4.0500 (14)	162
C9—H9B···Cg1 <sup>ii</sup>	0.99	2.81	3.6471	143

Symmetry codes: (i)  $x, -y+1/2, z-1/2$ ; (ii)  $x, -y-1/2, z-3/2$ .
